SCons Project API Documentation

This is the internal API Documentation for SCons. The Documentation is generated using the Sphinx tool. The target audience is developers working on SCons itself, so it does not clearly delineate what is “Public API” - interfaces for use in your SCons configuration scripts which have a consistency guarantee, and what is internal, so always keep the SCons manual page around for helping with such determinations.

SCons package

Module contents

Subpackages

SCons.Node package

Submodules

SCons.Node.Alias module

Alias nodes.

This creates a hash of global Aliases (dummy targets).

class SCons.Node.Alias.Alias (name)

class Attrs
    Bases: object

    shared

BuildInfo

Decider (function)

GetTag (key)
    Return a user-defined tag.

NodeInfo

Tag (key, value)
    Add a user-defined tag.

_add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_func_exists

_func_get_contents

_func_is_derived
__func_rexists

__func_target_from_source

__get_scanner (env, initial_scanner, root_node_scanner, kw)

__memo

__specific_sources

__tags

add_dependency (depend)
    Adds dependencies.

add_ignore (depend)
    Adds dependencies to ignore.

add_prerequisite (prerequisite)
    Adds prerequisites

add_source (source)
    Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
    Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don't think you can "clean up" this function by using True and False instead...)

add_to_waiting_s_e (node)

add_wkid (wkid)
    Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
    Return a list of all the node's direct children.

alter_targets ()
    Return a list of alternate targets for this Node.

always_build

attributes

binfo

build ()
    A "builder" for aliases.

builder

builder_set (builder)

built ()
    Called just after this node is successfully built.

cached

cached (node=None, allowcache=False)
Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.

Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.

The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().

@see: FS.File.changed(), FS.File.release_target_info()

### changed_since_last_build

Simple API to check if the node.attributes for name has been set

### children (scan=1)

Return a list of the node’s direct children, minus those that are ignored by this node.

### children_are_up_to_date ()

Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

### clear ()

Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

### clear.memoized_values ()

### convert ()

### del_binfo ()

Delete the build info from this node.

### depends

### depends_set

### disambiguate (must_exist=None)

### env

### env_set (env, safe=0)

### executor

Let the executor clean up any cached information.

### exists ()

Does this node exists?

### explain ()

### for_signature ()

Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need
to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
does not change.

get_abspath()
Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a
concept of relative path, this might return something different.

get_binfo()
Fetch a node’s build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
built and updated by someone else, if that’s what’s wanted.

get_build_env()
Fetch the appropriate Environment to build this node.

get_build_scanner_path(scanner)
Fetch the appropriate scanner path for this node.

get_builder(default_builder=None)
Return the set builder, or a specified default value

get_cachedir_csig()

get_contents()
The contents of an alias is the concatenation of the content signatures of all its sources.

get_csig()
Generate a node’s content signature, the digested signature of its content.
node - the node cache - alternate node to use for the signature cache returns - the content signature

get_env()

get_env_scanner(env, kw={})

get_executor(create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes(env, scanner, path)
Return the scanned include lines (implicit dependencies) found in this node.
The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
scanned for implicit dependencies.

get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
scanner, if the scanner’s recursive flag says that we should.

get_ninfo()

get_source_scanner(node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
Fetch the stored implicit dependencies
get_stored_info()

get_string(for_signature)

This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.

Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()

This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

has_builder()

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder()

Return whether this Node has an explicit builder

This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes

is_conftest()

Returns true if this node is an conftest node

is Derived()

Returns true if this node is derived (i.e. built).

This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()

Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()

Returns true if this node is an sconscript
is_under (dir)

is_up_to_date ()
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was
up-to-date, too.

linked

make_ready ()
Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a
Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing ()

multiple_side_effect_has_builder ()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if
node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

new_binfo ()

new_ninfo ()
ninfo

nocache

noclean

postprocess ()
Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare ()
Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and
initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the
targets built by a specific action.)
Overriding this method allows for for a Node subclass to remove the underlying file from the file system. Note
that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache ()
Try to push a node into a cache

really_build (**kw)
Actually build the node.
This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the
prepare() method has gotten everything, uh, prepared.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

```
ref_count
release_target_info()
    Called just after this node has been marked up-to-date or was built completely.
    This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
    By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
    @see: built() and File.release_target_info()
    
    remove()
    Remove this Node: no-op by default.
    
    render_include_tree()
    Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.
    
    reset_executor()
    Remove cached executor; forces recompute when needed.
    
    retrieve_from_cache()
    Try to retrieve the node’s content from a cache
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
    Returns true if the node was successfully retrieved.
    
    rexists()
    Does this node exist locally or in a repository?
    
    scan()
    Scan this node’s dependents for implicit dependencies.
    
    scanner_key()
    
    sconsign()
    An Alias is not recorded in .sconsign files
    
    select_scanner (scanner)
    Selects a scanner for this Node.
    This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.
    
    set_always_build (always_build=1)
    Set the Node’s always_build value.
    
    set_executor (executor)
    Set the action executor for this node.
    
    set_explicit (is_explicit)
    
    set_nocache (nocache=1)
    Set the Node’s nocache value.
    
    set_noctime (noclean=1)
    Set the Node’s noclean value.
    
    set_precious (precious=1)
    Set the Node’s precious value.
```
set_pseudo (pseudo=True)  
Set the Node's precious value.

set_specific_source (source)

set_state (state)

side_effect

side_effects

sources

sources_set

state

store_info

str_for_display ()

target_peers

visited ()
   Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.Alias.AliasBuildInfo
   Bases: SCons.Node.BuildInfoBase

bact

bactsig

bdepends

bdependsigs

bimplicit

bimplicitstigs

bsources

bsourcesigs

current_version_id = 2

merge (other)
   Merge the fields of another object into this object. Already existing information is overwritten by the other instance's data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

class SCons.Node.Alias.AliasNameSpace (**kwargs)
   Bases: collections.UserDict

Alias (name, **kw)
```python
_abcs_impl = <_abc_data object>

clear () → None. Remove all items from D.

copy ()

classmethod fromkeys (iterable, value=None)

get (k [, , d]) → D[k] if k in D, else d d defaults to None.

items () → a set-like object providing a view on D’s items

keys () → a set-like object providing a view on D’s keys

lookup (name, **kw)

pop (k [, , d]) → v, remove specified key and return the corresponding value.
If key is not found, d is returned if given, otherwise KeyError is raised.

popitem () → (k, v), remove and return some (key, value) pair
 as a 2-tuple; but raise KeyError if D is empty.

setdefault (k [, , d]) → D.get(k,d), also set D[k]=d if k not in D

update ([i, E], **F) → None. Update D from mapping/iterable E and F.
If E present and has a .keys() method, does: for k in E: D[k] = E[k] If E present and lacks .keys() method, does:
for (k, v) in E: D[k] = v In either case, this is followed by: for k, v in F.items(): D[k] = v

values () → an object providing a view on D’s values

convert (node, val)

csig

current_version_id = 2

field_list = [’csig’]

format (field_list=None, names=0)

merge (other)
Merge the fields of another object into this object. Already existing information is overwritten by the other
instance’s data. WARNING: If a ‘__dict__’ slot is added, it should be updated instead of replaced.

str_to_node (s)

update (node)

SCons.Node.FS module

File system nodes.

These Nodes represent the canonical external objects that people think of when they think of building software: files
and directories.

This holds a “default_fs” variable that should be initialized with an FS that can be used by scripts or modules looking
for the canonical default.

class SCons.Node.FS.Base (name, directory, fs)
```

A generic class for file system entries. This class is for when we don’t know yet whether the entry being looked up is a file or a directory. Instances of this class can morph into either Dir or File objects by a later, more precise lookup.

Note: this class does not define :meth:`__cmp__` and :meth:`__hash__` for efficiency reasons. SCons does a lot of comparing of :class:`Node.FS.{Base,Entry,File,Dir}` objects, so those operations must be as fast as possible, which means we want to use Python’s built-in object identity comparisons.

```python
class Attrs
    Bases: object

    shared

BuildInfo
    alias of :class:`SCons.Node.BuildInfoBase`

Decider (function)

GetTag (key)
    Return a user-defined tag.

NodeInfo

RDirs (pathlist)
    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
    Return all of the directories for a given path list, including corresponding “backing” directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)
    Add a user-defined tag.

_Rfindalldirs_key (pathlist)

_abspath

__add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

__children_get ()

__children_reset ()

__func_exists

__func_get_contents

__func_is_derived

__func_rexists

__func_sconsign

__func_target_from_source

__get_scanner (env, initial_scanner, root_node_scanner, kw)

__get_str ()
```
_glob1 (pattern, ondisk=True, source=False, strings=False)

__labspath

__local

__memo

__path

__path_elements

__proxy

__save_str ()

__specific_sources

__tags

__tpath

add_dependency (depend)
   Adds dependencies.

add_ignore (depend)
   Adds dependencies to ignore.

add_prerequisite (prerequisite)
   Adds prerequisites

add_source (source)
   Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
   Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
   (Note that the returned values are intended to be used to increment a reference count, so don’t think you can
   “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
   Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
   Return a list of all the node’s direct children.

alter_targets ()
   Return a list of alternate targets for this Node.

always_build

attributes

binfo

build (**kw)
   Actually build the node.
This is called by the Taskmaster after it's decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared. This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

**builder**

**builder_set (builder)**

**built ()**
 Called just after this node is successfully built.

**cached**

**changed (node=None, allowcache=False)**
 Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
 Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
 The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn't needed any longer for subsequent calls to changed().
 @see: FS.File.changed(), FS.File.release_target_info()  

**changed_since_last_build**

**check_attributes (name)**
 Simple API to check if the node.attributes for name has been set.

**children (scan=1)**
 Return a list of the node's direct children, minus those that are ignored by this node.

**children_are_up_to_date ()**
 Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

**clear ()**
 Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

**clear_memoized_values ()**

**cwd**

**del_binfo ()**
 Delete the build info from this node.

**depends**

**depends_set**

**dir**

**disambiguate (must_exist=None)**

**duplicate**

**env**
env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what.
    This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The
    purpose of this method is to generate a value to be used in signature calculation for the command line used to
    build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need
    to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
    does not change.

fs
    Reference to parent Node.FS object

get_abspath ()
    Get the absolute path of the file.

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
    the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
    built and updated by someone else, if that’s what’s wanted.

get_build_env ()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Fetch the contents of the entry.

get_csig ()

get_dir ()

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be scanned for implicit dependencies.

```python
get_implicit_deps (env, initial_scanner, path_func, kw={})
```

Return a list of implicit dependencies for this node. This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

```python
get_internal_path ()
```

```python
get_labspath ()
```

Get the absolute path of the file.

```python
get_ninfo ()
```

```python
get_path (dir=None)
```

Return path relative to the current working directory of the Node.FS.Base object that owns us.

```python
get_path_elements ()
```

```python
get_relpath ()
```

Get the path of the file relative to the root SConstruct file’s directory.

```python
get_source_scanner (node)
```

Fetch the source scanner for the specified node

NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner. Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified. This function may be called very often; it attempts to cache the scanner found to improve performance.

```python
get_state ()
```

```python
get_stored_implicit ()
```

Fetch the stored implicit dependencies

```python
get_stored_info ()
```

```python
get_string (for_signature)
```

This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.

Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

```python
get_subst_proxy ()
```

This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

```python
get_suffix ()
```

```python
get_target_scanner ()
```

```python
get_tpath ()
```

```python
getmtime ()
```

```python
getsize ()
```
has_builder()

Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder()

Return whether this Node has an explicit builder
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes

is_conftest()

Returns true if this node is a conftest node

isDerived()

Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()

Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()

Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()

Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will always get built.

isdir()

isfile()

islink()

linked

lstat()

make_ready()

Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()
multiple_side_effect_has_builder ()
    Return whether this Node has a builder or not.
    In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if
    node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
    __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
    and slowing things down immensely.

must_be_same (klass)
    This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.

name
new_binfo ()
new_ninfo ()
ninfo
nocache
noclean
postprocess ()
    Clean up anything we don’t need to hang onto after we’ve been built.

precious
prepare ()
    Prepare for this Node to be built.
    This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
    actually calling the method to build the Node.
    This default implementation checks that explicit or implicit dependencies either exist or are derived, and
    initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
    (The existence of source files is checked separately by the Executor, which aggregates checks for all of the
    targets built by a specific action.)
    Overriding this method allows for for a Node subclass to remove the underlying file from the file system. Note
    that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo
push_to_cache ()
    Try to push a node into a cache

ref_count
release_target_info ()
    Called just after this node has been marked up-to-date or was built completely.
    This is where we try to release as many target node infos as possible for clean builds and update runs, in order
    to minimize the overall memory consumption.
    By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that
    much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
    @see: built() and File.release_target_info()

remove ()
    Remove this Node: no-op by default.

render_include_tree ()
    Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.
rentry()

reset_executor()
Remove cached executor; forces recompute when needed.

retrieve_from_cache()
Try to retrieve the node’s content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists()
Does this node exist locally or in a repository?

rfile()

rstr()
A Node.FS.Base object’s string representation is its path name.

sbuilder

scan()
Scan this node’s dependents for implicit dependencies.

scanner_key()

select_scanner(scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build(always_build=1)
Set the Node’s always_build value.

set_executor(executor)
Set the action executor for this node.

set_explicit(is_explicit)

set_local()

set_nocache(nocache=1)
Set the Node’s nocache value.

set_no_clean(noclean=1)
Set the Node’s noclean value.

set_precious(precious=1)
Set the Node’s precious value.

set_pseudo(pseudo=True)
Set the Node’s precious value.

set_specific_source(source)

set_src_builder(builder)
Set the source code builder for this node.

set_state(state)

side_effect
side_effects

sources

sources_set

src_builder()
    Fetch the source code builder for this node.
    If there isn't one, we cache the source code builder specified for the directory (which in turn will cache the value
    from its parent directory, and so on up to the file system root).

srcnode()
    If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.

stat()

state

store_info

str_for_display()

target_from_source(prefix, suffix, splitext=<function splitext>)
    Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix.
    Note that this method can be overridden dynamically for generated files that need different behavior. See
    Tool/swig.py for an example.

target_peers

visited()
    Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.FS.Dir
    name, directory, fs)
    Bases: SCons.Node.FS.Base
    A class for directories in a file system.

class Attrs
    Bases: object

shared

BuildInfo
    alias of SCons.Node.FS.DirBuildInfo

Decider (function)

Dir(name, create=True)
    Looks up or creates a directory node named ‘name’ relative to this directory.

Entry(name)
    Looks up or creates an entry node named ‘name’ relative to this directory.

File(name)
    Looks up or creates a file node named ‘name’ relative to this directory.
GetTag (key)
Return a user-defined tag.

NodeInfo
alias of `SCons.Node.FS.DirNodeInfo`

Rdirs (pathlist)
Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
Return all of the directories for a given path list, including corresponding "backing" directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)
Add a user-defined tag.

_Rfindalldirs_key (pathlist)

__clearRepositoryCache (duplicate=None)
Called when we change the repository(ies) for a directory. This clears any cached information that is invalidated by changing the repository.

__resetDuplicate (node)

_abspath

_add_child (collection, set, child)
Adds 'child' to 'collection', first checking 'set' to see if it's already present.

_children_get ()

_children_reset ()

_create ()
Create this directory, silently and without worrying about whether the builder is the default or not.

_func_exists

_func_get_contents

_func_is-derived

_func_rexists

_func_sconsign

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_get_str ()

_glob1 (pattern, ondisk=True, source=False, strings=False)
Globs for and returns a list of entry names matching a single pattern in this directory. This searches any repositories and source directories for corresponding entries and returns a Node (or string) relative to the current directory if an entry is found anywhere. TODO: handle pattern with no wildcard

_labspath
Turn a file system Node (either a freshly initialized directory object or a separate Entry object) into a proper directory object.
Set up this directory’s entries and hook it into the file system tree. Specify that directories (this Node) don’t use signatures for calculating whether they’re current.

addRepository (dir)
add_dependency (depend)
    Adds dependencies.
add_ignore (depend)
    Adds dependencies to ignore.
add_prerequisite (prerequisite)
    Adds prerequisites
add_source (source)
    Adds sources.
add_to_implicit (deps)
add_to_waiting_parents (node)
    Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don’t think you can “clean up” this function by using True and False instead…)
add_to_waiting_s_e (node)
add_wkid (wkid)
    Add a node to the list of kids waiting to be evaluated
all_children (scan=1)
    Return a list of all the node’s direct children.
alter_targets ()
    Return any corresponding targets in a variant directory.
always_build

attributes

binfo

build(**kw)
    A null “builder” for directories.

builder

builder_set(builder)

built()
    Called just after this node is successfully built.

cached

cachedir_csig

cachesig

changed(node=None, allowcache=False)
    Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
    Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
    The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
    @see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build

check_attributes(name)
    Simple API to check if the node.attributes for name has been set

children(scan=1)
    Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date()
    Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

clear()
    Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

clear_memoized_values()

contentsig

cwd

del_binfo()
    Delete the build info from this node.

depends
depends_set

dir

dir_on_disk (name)

dirname

disambiguate (must_exist=None)

diskcheck_match ()

do_duplicate (src)

duplicate

entries

entry_abspath (name)

entry_exists_on_disk (name)
    Searches through the file/dir entries of the current directory, and returns True if a physical entry with the given name could be found.
    @see entry_exists_on_disk

entry_labspath (name)

entry_path (name)

entry_tpath (name)

env

env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

file_on_disk (name)

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs

getRepositories ()
    Returns a list of repositories for this directory.

get_abspath ()
Get the absolute path of the file.

get_all_rdirs()

get_binfo()
Fetch a node’s build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
built and updated by someone else, if that’s what’s wanted.

get_build_env()
Fetch the appropriate Environment to build this node.

get_build_scanner_path(scanner)
Fetch the appropriate scanner path for this node.

get_builder(default_builder=None)
Return the set builder, or a specified default value

get_cachedir_csig()

get_contents()
Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are
sorted.

get_csig()
Compute the content signature for Directory nodes. In general, this is not needed and the content signature is
not stored in the DirNodeInfo. However, if get_contents on a Dir node is called which has a child directory, the
child directory should return the hash of its contents.

get_dir()

get_env()

get_env_scanner(env, kw={})

get_executor(create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes(env, scanner, path)
Return this directory’s implicit dependencies.
We don’t bother caching the results because the scan typically shouldn’t be requested more than once (as
opposed to scanning .h file contents, which can be requested as many times as the files is #included by other
files).

get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
scanner, if the scanner’s recursive flag says that we should.

get_internal_path()

get_labspath()
Get the absolute path of the file.

get_ninfo()

get_path(dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.
get_path_elements()

get_relpath()
Get the path of the file relative to the root SConstruct file's directory.

get_source_scanner (node)
Fetch the source scanner for the specified node
NOTE: "self" is the target being built, "node" is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
Fetch the stored implicit dependencies

get_stored_info()

get_string (for_signature)
This is a convenience function designed primarily to be used in command generators (i.e.,
CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
argument that is nonzero if the command generator is being called to generate a signature for the command
line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a
string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()
This method is expected to return an object that will function exactly like this Node, except that it implements any
additional special features that we would like to be in effect for Environment variable substitution. The principle
use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

get_text_contents()
We already emit things in text, so just return the binary version.

get_timestamp()
Return the latest timestamp from among our children

get_tpath()

getmtime()

getsize()

glob (pathname, ondisk=True, source=False, strings=False, exclude=None)
Returns a list of Nodes (or strings) matching a specified pathname pattern.
Pathname patterns follow UNIX shell semantics: * matches any-length strings of any characters, ? matches any
character, and [] can enclose lists or ranges of characters. Matches do not span directory separators.
The matches take into account Repositories, returning local Nodes if a corresponding entry exists in a
Repository (either an in-memory Node or something on disk).
By default, the glob() function matches entries that exist on-disk, in addition to in-memory Nodes. Setting the
"ondisk" argument to False (or some other non-true value) causes the glob() function to only match in-memory
Nodes. The default behavior is to return both the on-disk and in-memory Nodes.
The “source” argument, when true, specifies that corresponding source Nodes must be returned if you’re
globbing in a build directory (initialized with VariantDir()). The default behavior is to return Nodes local to the
VariantDir().
The “strings” argument, when true, returns the matches as strings, not Nodes. The strings are path names
relative to this directory.
The “exclude” argument, if not None, must be a pattern or a list of patterns following the same UNIX shell
semantics. Elements matching a least one pattern of this list will be excluded from the result.
The underlying algorithm is adapted from the glob.glob() function in the Python library (but heavily modified), and
uses fnmatch() under the covers.

```
has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if
node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.
```

```
has_explicit_builder()
Return whether this Node has an explicit builder
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an
explicit builder that the user supplies (the canonical example being directories).
```

```
ignore
ignore_set
implicit
implicit_set
includes
is_conftest()
Returns true if this node is an conftest node
is_derived()
Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and
should contribute their build signatures when they are used as source files to other derived files. For example:
source with source builders are not derived in this sense, and hence should not return true.
```

```
is_explicit
is_literal()
Always pass the string representation of a Node to the command interpreter literally.
is_sconscript()
Returns true if this node is an sconscript
is_under(dir)
is_up_to_date()
If any child is not up-to-date, then this directory isn’t, either.
isdir()
isfile()
islink()
link(srcdir, duplicate)
Set this directory as the variant directory for the supplied source directory.

`linked`

`lstat()`

`make_ready()`  
Get a Node ready for evaluation.  
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

`missing()`

`multiple_side_effect_has_builder()`  
Return whether this Node has a builder or not.  
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ...”). When the builder attribute is examined directly, it ends up calling `__getattr__` for both the `__len__` and `__bool__` attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

`must_be_same(klass)`  
This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.

`name`

`new_binfo()`

`new_ninfo()`

`ninfo`

`nocache`

`noclean`

`on_disk_entries`

`postprocess()`  
Clean up anything we don’t need to hang onto after we’ve been built.

`precious`

`prepare()`  
Prepare for this Node to be built.  
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.  
This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.  
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)  
Overriding this method allows for for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

`prerequisites`

`pseudo`

`push_to_cache()`  
Try to push a node into a cache

`rdir()`
ref_count

rel_path (other)
   Return a path to “other” relative to this directory.

release_target_info()
   Called just after this node has been marked up-to-date or was built completely.
   This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
   By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
   @see: built() and File.release_target_info()

released_target_info

remove()
   Remove this Node: no-op by default.

render_include_tree()
   Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

rentry()

rentry_exists_on_disk(name)
   Searches through the file/dir entries of the current and all its remote directories (repos), and returns True if a physical entry with the given name could be found. The local directory (self) gets searched first, so repositories take a lower precedence regarding the searching order.
   @see entry_exists_on_disk

repositories

reset_executor()
   Remove cached executor; forces recompute when needed.

retrieve_from_cache()
   Try to retrieve the node’s content from a cache
   This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
   Returns true if the node was successfully retrieved.

rexists()
   Does this node exist locally or in a repository?

rfile()

root

rstr()
   A Node.FS.Base object’s string representation is its path name.

sbuilder

scan()
   Scan this node’s dependents for implicit dependencies.

scanner_key()
   A directory does not get scanned.

scanner_paths

sconsign()
Return the .sconsign file info for this directory.

`sconsign file info`

`select Scanner (scanner)`
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don't select one the Scanner.Selector that's configured for the target.

`set_always_build (always_build=1)`
Set the Node's always_build value.

`set_executor (executor)`
Set the action executor for this node.

`set_explicit (is_explicit)`

`set_local ()`

`set_nocache (nocache=1)`
Set the Node's nocache value.

`set_noct=1 (noclean=1)`
Set the Node's noclean value.

`set_precious (precious=1)`
Set the Node's precious value.

`set_pseudo (pseudo=True)`
Set the Node's precious value.

`set_specific_source (source)`

`set_src_builder (builder)`
Set the source code builder for this node.

`set_state (state)`

`side_effect`

`side_effects`

`sources`

`sources_set`

`src_builder ()`
Fetch the source code builder for this node.
If there isn't one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).

`srcdir`

`srcdir_duplicate (name)`

`srcdir_find_file (filename)`

`srcdir_list ()`

`srcnode ()`
Dir has a special need for srcnode()...if we have a srcdir attribute set, then that is our srcnode.
stat()

state

store_info

str_for_display()

target_from_source(prefix, suffix, splitext=<function splitext>)
Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix. Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

target_peers

up()

variant_dirs

visited()
Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

walk(func, arg)
Walk this directory tree by calling the specified function for each directory in the tree. This behaves like the os.path.walk() function, but for in-memory Node.FS.Dir objects. The function takes the same arguments as the functions passed to os.path.walk():

func(arg, dirname, fnames)
Except that “dirname” will actually be the directory Node, not the string. The ‘.’ and ‘..’ entries are excluded from fnames. The fnames list may be modified in-place to filter the subdirectories visited or otherwise impose a specific order. The “arg” argument is always passed to func() and may be used in any way (or ignored, passing None is common).

    Adds prerequisites

add_source (source)
    Adds sources.
add_to_implicit (deps)

add_to_waiting_parents (node)
    Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don’t think you can “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
    Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
    Return a list of all the node’s direct children.

alter_targets ()
    Return a list of alternate targets for this Node.

always_build

attributes

binfo

build (**kw)
    Actually build the node.
    This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared.
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

builder

builder_set (builder)

built ()
    Called just after this node is successfully built.

cached

cachedir_csig

cachesig

changed (node=None, allowcache=False)
    Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
    Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
    The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
    @see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build

check_attributes (name)
    Simple API to check if the node.attributes for name has been set
children (scan=1)
   Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date ()
   Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was
   up-to-date, too.

clear ()
   Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous
   integration builds).

clear_memoized_values ()

contentsig

cwd

del_binfo ()
   Delete the build info from this node.

depends

depends_set

dir

dirname

disambiguate (must_exist=None)

diskcheck_match ()

duplicate

duplicate
entries

env

eval_set (env, safe=0)

executor

executor_cleanup ()
   Let the executor clean up any cached information.

exists ()
   Does this node exists?

explain ()

for_signature ()
   Return a string representation of the Node that will always be the same for this particular Node, no matter what.
   This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The
   purpose of this method is to generate a value to be used in signature calculation for the command line used to
   build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need
   to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
   does not change.

fs
get_abspath ()
Get the absolute path of the file.

get_binfo ()
Fetch a node's build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache
returns - the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
built and updated by someone else, if that’s what’s wanted.

get_build_env ()
Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
Return the set builder, or a specified default value

get_cachedir_csigt ()

get_contents ()
Fetch the contents of the entry. Returns the exact binary contents of the file.

get_csig ()

get_dir ()

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
Return the scanned include lines (implicit dependencies) found in this node.
The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
scanned for implicit dependencies.

get_implicit_deps (env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
scanner, if the scanner’s recursive flag says that we should.

get_internal_path ()

get_labspatht ()
Get the absolute path of the file.

get_ninfo ()

get_path (dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements ()

get_relpatht ()
Get the path of the file relative to the root SConstruct file’s directory.

get_source_scanner (node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
    Fetch the stored implicit dependencies

get_stored_info()

get_string(for_signature)
This is a convenience function designed primarily to be used in command generators (i.e.,
CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
argument that is nonzero if the command generator is being called to generate a signature for the command
line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a
string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()
This method is expected to return an object that will function exactly like this Node, except that it implements any
additional special features that we would like to be in effect for Environment variable substitution. The principle
use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

get_text_contents()
    Fetch the decoded text contents of a Unicode encoded Entry.
    Since this should return the text contents from the file system, we check to see into what sort of subclass we
    should morph this Entry.

get_tpath()

getmtime()

getsize()

has_builder()
    Return whether this Node has a builder or not.
    In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if
node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

has_explicit_builder()
    Return whether this Node has an explicit builder
    This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an
explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit
implicit_set

includes

is_conftest()
Returns true if this node is a conftest node

is-derived()
Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()
Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()
Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will always get built.

isdir()

isfile()

islink()

linked

lstat()

make_ready()
Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

must_be_same(klass)
Called to make sure a Node is a Dir. Since we’re an Entry, we can morph into one.

name

new_binfo()

new_ninfo()

ninfo
nocache

clean

on_disk_entries

postprocess()
  Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
  Prepare for this Node to be built.
  This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
  actually calling the method to build the Node.
  This default implementation checks that explicit or implicit dependencies either exist or are derived, and
  initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
  (The existence of source files is checked separately by the Executor, which aggregates checks for all of the
  targets built by a specific action.)
  Overriding this method allows for for a Node subclass to remove the underlying file from the file system. Note
  that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()
  Try to push a node into a cache

ref_count

rel_path(others)

release_target_info()
  Called just after this node has been marked up-to-date or was built completely.
  This is where we try to release as many target node infos as possible for clean builds and update runs, in order
  to minimize the overall memory consumption.
  By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that
  much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
  @see: built() and File.release_target_info()

released_target_info

remove()
  Remove this Node: no-op by default.

render_include_tree()
  Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

rentry

repositories

reset_executor()
  Remove cached executor; forces recompute when needed.

retrieve_from_cache()
  Try to retrieve the node’s content from a cache
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
  unsafe stuff in built().
  Returns true if the node was successfully retrieved.
rexists ()
   Does this node exist locally or in a repository?

rfile ()
   We’re a generic Entry, but the caller is actually looking for a File at this point, so morph into one.

root

rstr ()
   A Node.FS.Base object’s string representation is its path name.

sbuilder

scan ()
   Scan this node’s dependents for implicit dependencies.

scanner_key ()

scanner_paths

searched

select_scanner (scanner)
   Selects a scanner for this Node.
   This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use
   their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build (always_build=1)
   Set the Node’s always_build value.

set_executor (executor)
   Set the action executor for this node.

set_explicit (is_explicit)

set_local ()

set_nocache (nocache=1)
   Set the Node’s nocache value.

set_noclean (noclean=1)
   Set the Node’s noclean value.

set_precious (precious=1)
   Set the Node’s precious value.

set_pseudo (pseudo=True)
   Set the Node’s precious value.

set_specific_source (source)

set_src_builder (builder)
   Set the source code builder for this node.

set_state (state)

side_effect

side_effects

sources
src_builder()
Fetch the source code builder for this node.
If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).

srcdir

srcnode()
If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.

stat()

state

store_info

str_for_display()

target_from_source(prefix, suffix, splitext=<function splitext>)
Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix. Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

target_peers

variant_dirs

visited()
Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.FS.EntryProxy (subject)
Bases: SCons.Util.Proxy

__get_abspath()

__get_base_path()
Return the file’s directory and file name, with the suffix stripped.

__get_dir()

__get_file()

__get_filebase()

__get_posix_path()
Return the path with / as the path separator, regardless of platform.

__get_relpath()

__get_rsrcdir()
Returns the directory containing the source node linked to this node via VariantDir(), or the directory of this node if not linked.
__get_rsrcnode ()

__get_srcdir ()
Returns the directory containing the source node linked to this node via VariantDir(), or the directory of this node if not linked.

__get_srcnode ()

__get_suffix ()

__get_windows_path ()
Return the path with as the path separator, regardless of platform.

dictSpecialAttrs = { 'abspath': <function EntryProxy.__get_abspath>, 'base': <function EntryProxy.__get_base_path>, 'dir': <function EntryProxy.__get_dir>, 'file': <function EntryProxy.__get_file>, 'filebase': <function EntryProxy.__get_filebase>, 'posix': <function EntryProxy.__get_posix_path>, 'relpath': <function EntryProxy.__get_relpath>, 'rsrcdir': <function EntryProxy.__get_rsrcdir>, 'rsrcpath': <function EntryProxy.__get_rsrcnode>, 'srcdir': <function EntryProxy.__get_srcdir>, 'srcpath': <function EntryProxy.__get_srcnode>, 'suffix': <function EntryProxy.__get_suffix>, 'win32': <function EntryProxy.__get_windows_path>, 'windows': <function EntryProxy.__get_windows_path> }

get ()
Retrieve the entire wrapped object

exception SCons.Node.FS.EntryProxyAttributeError (entry_proxy, attribute)
Bases: AttributeError
An AttributeError subclass for recording and displaying the name of the underlying Entry involved in an AttributeError exception.

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

class SCons.Node.FS.FS (path=None)
Bases: SCons.Node.FS.LocalFS

Dir (name, directory=None, create=True)
Look up or create a Dir node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.
This method will raise TypeError if a normal file is found at the specified path.

Entry (name, directory=None, create=1)
Look up or create a generic Entry node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.

File (name, directory=None, create=1)
Look up or create a File node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.
This method will raise TypeError if a directory is found at the specified path.

Glob (pathname, ondisk=True, source=True, strings=False, exclude=None, cwd=None)
Glob
This is mainly a shim layer

PyPackageDir (modulename)
Locate the directory of a given python module name
For example scons might resolve to Windows: C:Python27Libsite-packages\scons-2.5.1 Linux: /usr/lib/scons
This can be useful when we want to determine a toolpath based on a python module name

Repository(*dirs)
    Specify Repository directories to search.

VariantDir(variant_dir, src_dir, duplicate=1)
    Link the supplied variant directory to the source directory for purposes of building files.

__lookup__(p, directory, fsclass, create=1)
    The generic entry point for Node lookup with user-supplied data.
    This translates arbitrary input into a canonical Node.FS object of the specified fsclass. The general approach for
    strings is to turn it into a fully normalized absolute path and then call the root directory’s lookup_abs() method for
    the heavy lifting.
    If the path name begins with ‘#’, it is unconditionally interpreted relative to the top-level directory of this FS. ‘#’ is
    treated as a synonym for the top-level SConstruct directory, much like ‘~’ is treated as a synonym for the user’s
    home directory in a UNIX shell. So both ‘#foo’ and ‘#/foo’ refer to the ‘foo’ subdirectory underneath the top-level
    SConstruct directory.
    If the path name is relative, then the path is looked up relative to the specified directory, or the current directory
    (self._cwd, typically the SConscript directory) if the specified directory is None.

chdir(dir, change_os_dir=0)
    Change the current working directory for lookups. If change_os_dir is true, we will also change the “real” cwd to
    match.

chmod(path, mode)

copy(src, dst)

copy2(src, dst)

exists(path)

get_max_drift()

get_root(drive)
    Returns the root directory for the specified drive, creating it if necessary.

getcwd()

gmtime(path)

getsize(path)

isdir(path)

isfile(path)

islink(path)

link(src, dst)

listdir(path)

lstat(path)

makedirs(path, mode=511, exist_ok=False)

mkdir(path, mode=511)

open(path)
readlink (file)
rename (old, new)
scandir (path)
set_SConstruct_dir (dir)
set_max_drift (max_drift)
stat (path)
symlink (src, dst)
unlink (path)

variant_dir_target_climb (orig, dir, tail)
    Create targets in corresponding variant directories
    Climb the directory tree, and look up path names relative to any linked variant directories we find.
    Even though this loops and walks up the tree, we don't memoize the return value because this is really only
    used to process the command-line targets.

class SCons.Node.FS.File (name, directory, fs)
    Bases: SCons.Node.FS.Base
    A class for files in a file system.

class Attrs
    Bases: object

shared

BuildInfo
    alias of SCons.Node.FS.FileBuildInfo

Decider (function)

Dir (name, create=True)
    Create a directory node named 'name' relative to the directory of this file.

Dirs (pathlist)
    Create a list of directories relative to the SConscript directory of this file.

Entry (name)
    Create an entry node named 'name' relative to the directory of this file.

File (name)
    Create a file node named 'name' relative to the directory of this file.

GetTag (key)
    Return a user-defined tag.

NodeInfo
    alias of SCons.Node.FS.FileNodeInfo

RDirs (pathlist)
    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
    Return all of the directories for a given path list, including corresponding "backing" directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.
Tag (key, value)
   Add a user-defined tag.

_Rfindaldirs_key (pathlist)

__dmap_cache = {}  
__dmap_sig_cache = {}

_abspath

_add_child (collection, set, child)
   Adds 'child' to 'collection', first checking 'set' to see if it's already present.

_add_strings_to_dependency_map (dmap)
   In the case comparing node objects isn't sufficient, we'll add the strings for the nodes to the dependency map.

_build_dependency_map (binfo)
   Build mapping from file -> signature

   Parameters:
      - self (self) –
      - buildinfo from node being considered (binfo) –

   Returns: dictionary of file->signature mappings

_children_get ()

_children_reset ()

_createDir ()

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_sconsign

_func_target_from_source

_get_found_includes_key (env, scanner, path)

_get_previous_signatures (dmap)
   Return a list of corresponding csigs from previous build in order of the node/files in children.

   Parameters:
      - self (self) –
      - Dictionary of file -> csig (dmap) –

   Returns: List of csigs for provided list of children

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_get_str ()

_glob1 (pattern, ondisk=True, source=False, strings=False)

_labspath
Turn a file system node into a File object.

Adds dependencies.

Add a node to the list of kids waiting to be evaluated

Return a list of all the node’s direct children.

Return any corresponding targets in a variant directory.

Return any corresponding targets in a variant directory.
build (**kw)**  
Actually build the node.  
This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared.  
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

**builder**

**builder_set (builder)**

**built ()**  
Called just after this File node is successfully built.  
Just like for `release_target_info` we try to release some more target node attributes in order to minimize the overall memory consumption.  
@see: release_target_info

**cached**

**cachedir_csig**

**cachesig**

**changed (node=None, allowcache=False)**  
Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built.  
For File nodes this is basically a wrapper around Node.changed(), but we allow the return value to get cached after the reference to the Executor got released in release_target_info().  
@see: Node.changed()

**changed_content (target, prev_ni, repo_node=None)**

**changed_since_last_build**

**changed_timestamp_match (target, prev_ni, repo_node=None)**  
Return True if the timestamps don’t match or if there is no previous timestamp.  
Information about the node from the previous build.

**changed_timestamp_newer (target, prev_ni, repo_node=None)**

**changed_timestamp_then_content (target, prev_ni, node=None)**  
Used when decider for file is Timestamp-MD5  
NOTE: If the timestamp hasn’t changed this will skip md5’ing the file and just copy the prev_ni provided. If the prev_ni is wrong. It will propagate it. See:  
https://github.com/SCons/scons/issues/2980  
Parameters:

---  
- dependency (**self**)  
- target (**target**)  
- The NodeInfo object loaded from previous builds (**sconsign (prev_ni)**  
- Node instance. Check this node for file existence/timestamp (**node**) – if specified.  

**Returns:** Boolean - Indicates if node(File) has changed.

**check_attributes (name)**  
Simple API to check if the node.attributes for name has been set

**children (scan=1)**
Return a list of the node’s direct children, minus those that are ignored by this node.

`children_are_up_to_date()`  
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

`clear()`  
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

`clear_memoized_values()`

`contentsig`

```python
convert_copy_attrs = ['bsources', 'bimplicit', 'bdepends', 'bact', 'bactsig', 'ninfo']
```

`convert_old_entry(old_entry)`

```python
convert_sig_attrs = ['bsourcesigs', 'bimplicit_sigs', 'bdependsigs']
```

`cwd`

`del_binfo()`  
Delete the build info from this node.

`depends`

`depends_set`

`dir`

`dirname`

`disambiguate(must_exist=None)`

`diskcheck_match()`

`do_duplicate(src)`

`duplicate`

`entries`

`env`

`env_set(env, safe=0)`

`executor`

`executor_cleanup()`  
Let the executor clean up any cached information.

`exists()`  
Does this node exists?

`explain()`

`find_repo_file()`  
For this node, find if there exists a corresponding file in one or more repositories :return: list of corresponding files in repositories
find_src_builder()

for_signature()
Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs

get_abspath()
Get the absolute path of the file.

get_binfo()
Fetch a node’s build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env()
Fetch the appropriate Environment to build this node.

get_build_scanner_path(scanner)
Fetch the appropriate scanner path for this node.

get_builder(default_builder=None)
Return the set builder, or a specified default value

get_cachedir_bsig()
Return the signature for a cached file, including its children.
It adds the path of the cached file to the cache signature, because multiple targets built by the same action will all have the same build signature, and we have to differentiate them somehow.
Signature should normally be string of hex digits.

get_cachedir_csig()
Fetch a Node’s content signature for purposes of computing another Node’s cachesig.
This is a wrapper around the normal get_csig() method that handles the somewhat obscure case of using CacheDir with the -n option. Any files that don’t exist would normally be “built” by fetching them from the cache, but the normal get_csig() method will try to open up the local file, which doesn’t exist because the -n option meant we didn’t actually pull the file from cachedir. But since the file does actually exist in the cachedir, we can use its contents for the csig.

get_content_hash() \rightarrow str
Compute and return the hash for this file.

get_contents() \rightarrow bytes
Return the contents of the file as bytes.

get_contents_sig()
A helper method for get_cachedir_bsig.
It computes and returns the signature for this node’s contents.

get_csig() \rightarrow str
Generate a node’s content signature.

get_dir()

get_env()
get_env_scanner (env, kw={})

get_executor (create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
Return the included implicit dependencies in this file. Cache results so we only scan the file once per path regardless of how many times this information is requested.

get_implicit_deps (env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

get_internal_path ()

get_labspath ()
Get the absolute path of the file.

get_max_drift_csig () ➔ Optional[str]
Returns the content signature currently stored for this node if it’s been unmodified longer than the max_drift value, or the max_drift value is 0. Returns None otherwise.

get_ninfo ()

get_path (dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements ()

get_relpath ()
Get the path of the file relative to the root SConstruct file’s directory.

get_size () ➔ int

get_source_scanner (node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy ()
This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

```python
get_suffix()
get_target_scanner()
get_text_contents() → str
Return the contents of the file in text form. This attempts to figure out what the encoding of the text is based upon the BOM bytes, and then decodes the contents so that it’s a valid python string.
get_timestamp() → int
get_tpath()
getmtime()
getsize()

has_builder()
Return whether this Node has a builder or not. In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder()
Return whether this Node has an explicit builder. This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

has_src_builder()
Return whether this Node has a source builder or not. If this Node doesn’t have an explicit source code builder, this is where we figure out, on the fly, if there’s a transparent source code builder for it.
Note that if we found a source builder, we also set the self.builder attribute, so that all of the methods that actually build this file don’t have to do anything different.

hash_chunksize = 65536

ignore
ignore_set
implicit
implicit_set
includes

is_conftest()
Returns true if this node is a conftest node

is_derived()
Returns true if this node is derived (i.e. built). This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit
is_literal()
    Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()
    Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()
    Check for whether the Node is current. In all cases, self is the target we're checking to see if it's up to date

isdir()

isfile()

islink()

linked

lstat()

make_ready()
    Get a Node ready for evaluation.
    This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a
    Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()
    Return whether this Node has a builder or not.
    In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if
    node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
    __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
    and slowing things down immensely.

must_be_same(klass)
    This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn't.

name

new_binfo()

new_ninfo()

ninfo

nocache

noclean

on_disk_entries

postprocess()
    Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
    Prepare for this file to be created.

prerequisites
pseudo

push_to_cache ()
    Try to push the node into a cache

ref_count

rel_path (other)

release_target_info ()
    Called just after this node has been marked up-to-date or was built completely.
    This is where we try to release as many target node infos as possible for clean builds and update runs, in order
    to minimize the overall memory consumption.
    We’d like to remove a lot more attributes like self.sources and self.sources_set, but they might get used in a next
    build step. For example, during configuration the source files for a built E(*)o file are used to figure out which
    linker to use for the resulting Program (gcc vs. g++)! That’s why we check for the ‘keep_targetinfo’ attribute,
    config Nodes and the Interactive mode just don’t allow an early release of most variables.
    In the same manner, we can’t simply remove the self.attributes here. The smart linking relies on the shared flag,
    and some parts of the java Tool use it to transport information about nodes...
    @see: built() and Node.release_target_info()

released_target_info

remove ()
    Remove this file.

render_include_tree ()
    Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

rentry ()

repositories

reset_executor ()
    Remove cached executor; forces recompute when needed.

retrieve_from_cache ()
    Try to retrieve the node’s content from a cache
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
    unsafe stuff in built().
    Returns true if the node was successfully retrieved.

rexists ()
    Does this node exist locally or in a repository?

rfile ()

root

rstr ()
    A Node.FS.Base object’s string representation is its path name.

sbuilder

scan ()
    Scan this node’s dependents for implicit dependencies.

scanner_key ()

scanner_paths
searched

select_scanner (scanner)
    Selects a scanner for this Node.
    This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build (always_build=1)
    Set the Node’s always_build value.

set_executor (executor)
    Set the action executor for this node.

set_explicit (is_explicit)

set_local ()

set_nocache (nocache=1)
    Set the Node’s nocache value.

set_noClean (noclean=1)
    Set the Node’s noClean value.

set_precious (precious=1)
    Set the Node’s precious value.

set_pseudo (pseudo=True)
    Set the Node’s precious value.

set_specific_source (source)

set_src_builder (builder)
    Set the source code builder for this node.

set_state (state)

side_effect

side_effects

sources

sources_set

src_builder ()
    Fetch the source code builder for this node.
    If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).

srcdir

srcnode ()
    If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.

stat ()

state

store_info

str_for_display ()
target_from_source (prefix, suffix, splitext=<function splitext>)
Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix.
Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

target_peers

variant_dirs

visited()
Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.FS.FileBuildInfo
Bases: SCons.Node.BuildInfoBase
This is info loaded from sconsign.

Attributes unique to FileBuildInfo:

dependency_map : Caches file->csig mapping
for all dependencies. Currently this is only used when using MD5-timestamp decider. It’s used to ensure
that we copy the correct csig from the previous build to be written to .sconsign when current build is done.
Previously the matching of csig to file was strictly by order they appeared in bdepends, bsources, or
bimplicit, and so a change in order or count of any of these could yield writing wrong csig, and then false
positive rebuilds

bact

bactsig

bdepends

bdependssigs

bimplicit

bimplicitssigs

bsources

bsourcesigs

convert_from_sconsign (dir, name)
Converts a newly-read FileBuildInfo object for in-SCons use
For normal up-to-date checking, we don’t have any conversion to perform–but we’re leaving this method here to
make that clear.

convert_to_sconsign ()
Converts this FileBuildInfo object for writing to a .sconsign file
This replaces each Node in our various dependency lists with its usual string representation: relative to the
top-level SConstruct directory, or an absolute path if it’s outside.

current_version_id = 2

dependency_map

format (names=0)
merge (other)
Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a ‘__dict__’ slot is added, it should be updated instead of replaced.

prepare_dependencies()
Prepares a FileBuildInfo object for explaining what changed
The bsources, bdepends and bimplicit lists have all been stored on disk as paths relative to the top-level SConstruct directory. Convert the strings to actual Nodes (for use by the –debug=explain code and –implicit-cache).

exception SCons.Node.FS.FileBuildInfoFileToCsigMappingError
Bases: Exception

args

with_traceback()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

class SCons.Node.FS.FileFinder
Bases: object

__find_file_key__ (filename, paths, verbose=None)

filedir_lookup (p, fd=None)
A helper method for find_file() that looks up a directory for a file we’re trying to find. This only creates the Dir Node if it exists on-disk, since if the directory doesn’t exist we know we won’t find any files in it… :-)
It would be more compact to just use this as a nested function with a default keyword argument (see the commented-out version below), but that doesn’t work unless you have nested scopes, so we define it here just so this work under Python 1.5.2.

find_file (filename, paths, verbose=None)
Find a node corresponding to either a derived file or a file that exists already.
Only the first file found is returned, and none is returned if no file is found.
filename: A filename to find
paths: A list of directory path nodes to search in. Can be represented as a list, a tuple, or a callable that is called with no arguments and returns the list or tuple.
returns The node created from the found file.

class SCons.Node.FS.FileNodeInfo

convert (node, val)

csig

current_version_id = 2
field_list = ['csig', 'timestamp', 'size']
format (field_list=None, names=0)
fs = None
merge (other)
Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a ‘__dict__’ slot is added, it should be updated instead of replaced.

size

str_to_node(s)
timestamp
update (node)

SCons.Node.FS.LinkFunc (target, source, env)
Relative paths cause problems with symbolic links, so we use absolute paths, which may be a problem for people who want to move their soft-linked src-trees around. Those people should use the ‘hard-copy’ mode, softlinks cannot be used for that; at least I have no idea how ...

class SCons.Node.FS.LocalFS
Bases: object
This class implements an abstraction layer for operations involving a local file system. Essentially, this wraps any function in the os, os.path or shutil modules that we use to actually go do anything with or to the local file system. Note that there’s a very good chance we’ll refactor this part of the architecture in some way as we really implement the interface(s) for remote file system Nodes. For example, the right architecture might be to have this be a subclass instead of a base class. Nevertheless, we’re using this as a first step in that direction.
We’re not using chdir() yet because the calling subclass method needs to use os.chdir() directly to avoid recursion. Will we really need this one?

chmod (path, mode)

copy (src, dst)
copy2 (src, dst)
exists (path)
gmtime (path)
getsize (path)
issdir (path)
issfile (path)
isslink (path)
link (src, dst)
listdir (path)
lstat (path)
makedirs (path, mode=511, exist_ok=False)
mkdir (path, mode=511)
open (path)
readlink (file)
rename (old, new)
scandir (path)
stat (path)
symlink (src, dst)
unlink (path)
SCons.Node.FS.LocalString (target, source, env)
SCons.Node.FS.MkdirFunc (target, source, env)
class SCons.Node.FS.RootDir (drive, fs)
Bases: SCons.Node.FS.Dir
A class for the root directory of a file system.
This is the same as a Dir class, except that the path separator ('/' or ' ') is actually part of the name, so we don't need to add a separator when creating the path names of entries within this directory.

class Attrs
Bases: object

    shared

BuildInfo
alias of SCons.Node.FS.DirBuildInfo

Decider (function)

Dir (name, create=True)
    Looks up or creates a directory node named ‘name’ relative to this directory.

Entry (name)
    Looks up or creates an entry node named ‘name’ relative to this directory.

File (name)
    Looks up or creates a file node named ‘name’ relative to this directory.

GetTag (key)
    Return a user-defined tag.

NodeInfo
alias of SCons.Node.FS.DirNodeInfo

RDirs (pathlist)
    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
    Return all of the directories for a given path list, including corresponding “backing” directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)
    Add a user-defined tag.

__Rfindalldirs_key (pathlist)

_abspath

__add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

__children_get ()

__children_reset ()

__create ()
    Create this directory, silently and without worrying about whether the builder is the default or not.

__func_exists

__func_get_contents

__func_is-derived
_func_reexists

_func_sconsign

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_get_str ()

_glob1 (pattern, ondisk=True, source=False, strings=False)
Globs for and returns a list of entry names matching a single pattern in this directory.
This searches any repositories and source directories for corresponding entries and returns a Node (or string)
relative to the current directory if an entry is found anywhere.
TODO: handle pattern with no wildcard

__labspath

__local

__lookupDict

__lookup_abs (p, klass, create=1)
Fast (?) lookup of a normalized absolute path.
This method is intended for use by internal lookups with already-normalized path data. For general-purpose
lookups, use the FS.Entry(). FS.Dir() or FS.File() methods.
The caller is responsible for making sure we’re passed a normalized absolute path; we merely let Python’s
dictionary look up and return the One True Node.FS object for the path.
If a Node for the specified “p” doesn’t already exist, and “create” is specified, the Node may be created after
recursive invocation to find or create the parent directory or directories.

__memo

__morph ()
Turn a file system Node (either a freshly initialized directory object or a separate Entry object) into a proper
directory object.
Set up this directory’s entries and hook it into the file system tree. Specify that directories (this Node) don’t use
signatures for calculating whether they’re current.

__path

__path_elements

__proxy

__rel_path_key (other)

__save_str ()

__sconsign

__specific_sources

__srcdir_find_file_key (filename)

__tags

__tpath

__abspath

SCons Project API Documentation

57
addRepository (dir)

add_dependency (depend)
    Adds dependencies.

add_ignore (depend)
    Adds dependencies to ignore.

add_prerequisite (prerequisite)
    Adds prerequisites

add_source (source)
    Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
    Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
    (Note that the returned values are intended to be used to increment a reference count, so don’t think you can
    “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
    Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
    Return a list of all the node’s direct children.

alter_targets ()
    Return any corresponding targets in a variant directory.

always_build

attributes

binfo

build (**kw)
    A null “builder” for directories.

builder

builder_set (builder)

built ()
    Called just after this node is successfully built.

cached

cachedir_csig

cachesig

changed (node=None, allowcache=False)
    Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is
to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically
one in a Repository) can be used instead.
    Note that we now always check every dependency. We used to short-circuit the check by returning as soon as
we detected any difference, but we now rely on checking every dependency to make sure that any necessary
Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build

check_attributes (name)
Simple API to check if the node.attributes for name has been set

children (scan=1)
Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date ()
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

clear ()
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

clear_memoized_values ()

contentsig

cwd

del_binfo ()
Delete the build info from this node.

depends

depends_set

dir

dir_on_disk (name)

dirname

disambiguate (must_exist=None)

diskcheck_match ()

do_duplicate (src)

duplicate

entries

entry_abspath (name)

entry_exists_on_disk (name)
Searches through the file/dir entries of the current directory, and returns True if a physical entry with the given name could be found.
@see: entry_exists_on_disk

entry_labspath (name)

entry_path (name)
entry_tpath (name)

env_set (env, safe=0)

executor()

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

file_on_disk (name)

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs
    Reference to parent Node.FS object

getRepositories ()
    Returns a list of repositories for this directory.

get_abspath ()
    Get the absolute path of the file.

get_all_rdirs ()

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache
    returns - the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env ()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are sorted.

get_csig ()
Compute the content signature for Directory nodes. In general, this is not needed and the content signature is not stored in the DirNodeInfo. However, if get_contents on a Dir node is called which has a child directory, the child directory should return the hash of its contents.

```
get_dir()
```

```
get_env()
```

```
get_env_scanner(env, kw={})
```

```
get_executor(create=1)
```

Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

```
get_foundIncludes(env, scanner, path)
```

Return this directory’s implicit dependencies. We don’t bother caching the results because the scan typically shouldn’t be requested more than once (as opposed to scanning .h file contents, which can be requested as many times as the files is #included by other files).

```
get_implicit_deps(env, initial_scanner, path_func, kw={})
```

Return a list of implicit dependencies for this node. This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

```
get_internal_path()
```

```
get_labspath()
```

Get the absolute path of the file.

```
get_ninfo()
```

```
get_path(dir=None)
```

Return path relative to the current working directory of the Node.FS.Base object that owns us.

```
get_path_elements()
```

```
get_relpath()
```

Get the path of the file relative to the root SConstruct file’s directory.

```
get_source_scanner(node)
```

Fetch the source scanner for the specified node

NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner. Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified. This function may be called very often; it attempts to cache the scanner found to improve performance.

```
get_state()
```

```
get_stored_implicit()
```

Fetch the stored implicit dependencies

```
get_stored_info()
```

```
get_string(for_signature)
```

This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not. Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.
get_subst_proxy ()
This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix ()

get_target_scanner ()

get_text_contents ()
We already emit things in text, so just return the binary version.

get_timestamp ()
Return the latest timestamp from among our children

get_tpath ()

getmtime ()

getsize ()

glob (pathname, ondisk=True, source=False, strings=False, exclude=None)
Returns a list of Nodes (or strings) matching a specified pathname pattern. Pathname patterns follow UNIX shell semantics: * matches any-length strings of any characters, \? matches any character, and [ ] can enclose lists or ranges of characters. Matches do not span directory separators. The matches take into account Repositories, returning local Nodes if a corresponding entry exists in a Repository (either an in-memory Node or something on disk). By default, the glob() function matches entries that exist on-disk, in addition to in-memory Nodes. Setting the “ondisk” argument to False (or some other non-true value) causes the glob() function to only match in-memory Nodes. The default behavior is to return both the on-disk and in-memory Nodes. The “source” argument, when true, specifies that corresponding source Nodes must be returned if you’re globbing in a build directory (initialized with VariantDir()). The default behavior is to return Nodes local to the VariantDir(). The “strings” argument, when true, returns the matches as strings, not Nodes. The strings are path names relative to this directory. The “exclude” argument, if not None, must be a pattern or a list of patterns following the same UNIX shell semantics. Elements matching a least one pattern of this list will be excluded from the result. The underlying algorithm is adapted from the glob.glob() function in the Python library (but heavily modified), and uses fnmatch() under the covers.

has_builder ()
Return whether this Node has a builder or not. In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder ()
Return whether this Node has an explicit builder. This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set
includes

**is_conftest()**

Returns true if this node is an conftest node

**is_derived()**

Returns true if this node is derived (i.e. built).

This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

**is_explicit**

**is_literal()**

Always pass the string representation of a Node to the command interpreter literally.

**is_sconscript()**

Returns true if this node is an sconscript

**is_under(dir)**

**is_up_to_date()**

If any child is not up-to-date, then this directory isn’t, either.

**isdir()**

**isfile()**

**islink()**

**link(srcdir, duplicate)**

Set this directory as the variant directory for the supplied source directory.

**linked**

**lstat()**

**make_ready()**

Get a Node ready for evaluation.

This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

**missing()**

**multiple_side_effect_has_builder()**

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

**must_be_same(klass)**

This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.

**name**

**new_binfo()**

**new_ninfo()**

**ninfo**
nocache
	noclean

on_disk_entries

path

postprocess()
    Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
    Prepare for this Node to be built.
    This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
    actually calling the method to build the Node.
    This default implementation checks that explicit or implicit dependencies either exist or are derived, and
    initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
    (The existence of source files is checked separately by the Executor, which aggregates checks for all of the
    targets built by a specific action.)
    Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note
    that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()
    Try to push a node into a cache

rdir()

ref_count

rel_path(other)
    Return a path to “other” relative to this directory.

release_target_info()
    Called just after this node has been marked up-to-date or was built completely.
    This is where we try to release as many target node infos as possible for clean builds and update runs, in order
    to minimize the overall memory consumption.
    By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that
    much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
    @see: built() and File.release_target_info()

released_target_info

remove()
    Remove this Node: no-op by default.

render_include_tree()
    Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

reentry()

reentry_exists_on_disk(name)
    Searches through the file/dir entries of the current and all its remote directories (repos), and returns True if a
    physical entry with the given name could be found. The local directory (self) gets searched first, so repositories
    take a lower precedence regarding the searching order.
    @see entry_exists_on_disk
repositories

reset_executor()
   Remove cached executor; forces recompute when needed.

retrieve_from_cache()
   Try to retrieve the node’s content from a cache
   This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
   unsafe stuff in built().
   Returns true if the node was successfully retrieved.

rexists()
   Does this node exist locally or in a repository?

rfile()

root

rstr()
   A Node.FS.Base object’s string representation is its path name.

sbuilder

scan()
   Scan this node’s dependents for implicit dependencies.

scanner_key()
   A directory does not get scanned.

scanner_paths

sconsign()
   Return the .sconsign file info for this directory.

searched

select_scanner(scanner)
   Selects a scanner for this Node.
   This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use
   their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build(always_build=1)
   Set the Node’s always_build value.

set_executor(executor)
   Set the action executor for this node.

set_explicit(is_explicit)

set_local()

set_nocache(nocache=1)
   Set the Node’s nocache value.

set_noclean(noclean=1)
   Set the Node’s noclean value.

set_precious(precious=1)
   Set the Node’s precious value.

set_pseudo(pseudo=True)
Set the Node's precious value.

This behaves like the os.path.walk() function, but for in-memory Node.FS.Dir objects. The function takes the same arguments as the functions passed to os.path.walk:

```
func(arg, dirname, filenames)
```

Except that "dirname" will actually be the directory Node, not the string. The '.' and '..' entries are excluded from filenames. The filenames list may be modified in-place to filter the subdirectories visited or otherwise impose a specific order. The "arg" argument is always passed to func() and may be used in any way (or ignored, passing None is common).

```
wkids
```

```
SCons.Node.FS.UnlinkFunc (target, source, env)
```

```
class SCons.Node.FS._Null
    Bases: object
```

```
SCons.Node.FS._classEntry
    alias of SCons.Node.FS.Entry
```

```
SCons.Node.FS._copy_func (fs, src, dest)
SCons.Node.FS._hardlink_func (fs, src, dst)
SCons.Node.FS._my_normcase (x)
SCons.Node.FS._my_splitdrive (p)
SCons.Node.FS._softlink_func (fs, src, dst)
SCons.Node.FS.diskcheck_types ()
SCons.Node.FS.do_diskcheck_match (node, predicate, errorfmt)
SCons.Node.FS.find_file (filename, paths, verbose=None)
    Find a node corresponding to either a derived file or a file that exists already. Only the first file found is returned, and none is returned if no file is found.
    filename: A filename to find
    paths: A list of directory path nodes that can be represented as a list, a tuple, or a callable that is called with no arguments and returns the list or tuple.
    returns: The node created from the found file.
```

```
SCons.Node.FS.get_MkdirBuilder ()
SCons.Node.FS.get_default_fs ()
SCons.Node.FS.has_glob_magic (s)
SCons.Node.FS.ignore_diskcheck_match (node, predicate, errorfmt)
SCons.Node.FS.initialize_do_splitdrive ()
SCons.Node.FS.invalidate_node_memos (targets)
    Invalidate the memoized values of all Nodes (files or directories) that are associated with the given entries. Has been added to clear the cache of nodes affected by a direct execution of an action (e.g. Delete/Copy/Chmod). Existing Node caches become inconsistent if the action is run through Execute(). The argument targets can be a single Node object or filename, or a sequence of Nodes/filenames.
```

```
SCons.Node.FS.needs_normpath_match (string, pos=0, endpos=9223372036854775807)
    Matches zero or more characters at the beginning of the string.
```

```
SCons.Node.FS.save_strings (val)
SCons.Node.FS.sconsign_dir (node)
    Return the .sconsign file info for this directory, creating it first if necessary.
```

```
SCons.Node.FS.sconsign_none (node)
SCons.Node.FS.set_diskcheck (list)
SCons.Node.FS.set_duplicate (duplicate)
SCons.Node.Python module

Python nodes.

class SCons.Node.Python.Value (value, built_value=None, name=None)
A class for Python variables, typically passed on the command line or generated by a script, but not from a file or some other source.

class Attrs
    Bases: object

    shared

BuildInfo

Decider (function)

GetTag (key)
    Return a user-defined tag.

NodeInfo

Tag (key, value)
    Add a user-defined tag.

_add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_memo

_specific_sources

_tags

add_dependency (depend)
    Adds dependencies.

add_ignore (depend)
    Adds dependencies to ignore.

add_prerequisite (prerequisite)
    Adds prerequisites
add_source (source)
  Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
  Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
  (Note that the returned values are intended to be used to increment a reference count, so don’t think you can
  “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
  Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
  Return a list of all the node’s direct children.

alter_targets ()
  Return a list of alternate targets for this Node.

always_build

attributes

binfo

build (**kw)
  Actually build the node.
  This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the
  prepare() method has gotten everything, uh, prepared.
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
  unsafe stuff in built().

builder

builder_set (builder)

built ()
  Called just after this node is successfully built.

cached

cached_changed (node=None, allowcache=False)
  Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is
to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically
one in a Repository) can be used instead.
  Note that we now always check every dependency. We used to short-circuit the check by returning as soon as
we detected any difference, but we now rely on checking every dependency to make sure that any necessary
Node information (for example, the content signature of an #included .h file) is updated.
  The allowcache option was added for supporting the early release of the executor/builder structures, right after a
File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like
this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

cached_since_last_build

check_attributes (name)
  Simple API to check if the node.attributes for name has been set

cached_children (scan=1)
Return a list of the node’s direct children, minus those that are ignored by this node.

`children_are_up_to_date()`
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

`clear()`
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

`clear_memoized_values()`

`del_binfo()`
Delete the build info from this node.

`depends`

`depends_set`

`disambiguate(must_exist=None)`

`env`

`env_set(env, safe=0)`

`executor`

`executor_cleanup()`
Let the executor clean up any cached information.

`exists()`
Does this node exists?

`explain()`

`for_signature()`
Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

`get_abspath()`
Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a concept of relative path, this might return something different.

`get_binfo()`
Fetch a node’s build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

`get_build_env()`
Fetch the appropriate Environment to build this node.

`get_build_scanner_path(scanner)`
Fetch the appropriate scanner path for this node.
get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents () → bytes
    Get contents for signature calculations.

get_csig (calc=None)
    Because we’re a Python value node and don’t have a real timestamp, we get to ignore the calculator and just
    use the value contents.
    Returns string. Ideally string of hex digits. (Not bytes)

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
    scanned for implicit dependencies.

get_implicit_deps (env, initial_scanner, path_func, kw={})
    Return a list of implicit dependencies for this node.
    This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
    scanner, if the scanner’s recursive flag says that we should.

get_ninfo ()

get_source_scanner (node)
    Fetch the source scanner for the specified node
    NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
    Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
    This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
    Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
    This is a convenience function designed primarily to be used in command generators (i.e.,
    CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
    argument that is nonzero if the command generator is being called to generate a signature for the command
    line, which determines if we should rebuild or not.
    Such command generators should use this method in preference to str(Node) when converting a Node to a
    string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
    depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy ()
    This method is expected to return an object that will function exactly like this Node, except that it implements any
    additional special features that we would like to be in effect for Environment variable substitution. The principle
    use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
    has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
    method to return self if no new functionality is needed for Environment substitution.
get_suffix()

get_target_scanner()

get_text_contents() \rightarrow \text{str}

By the assumption that the node\_built\_value is a deterministic product of the sources, the contents of a Value are the concatenation of all the contents of its sources. As the value need not be built when get\_contents() is called, we cannot use the actual node\_built\_value.

has_builder()

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling \_getattr\_ for both the \_len\_ and \_bool\_ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder()

Return whether this Node has an explicit builder

This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes

is_conftest()

Returns true if this node is an conftest node

is_derived()

Returns true if this node is derived (i.e. built).

This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()

Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()

Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()

Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

linked

make_ready()

Get a Node ready for evaluation.

This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.
missing()

**multiple_side_effect_has_builder()**
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

new_binfo()

new_ninfo()

ninfo

nocache

noclean

**postprocess()**
Clean up anything we don’t need to hang onto after we’ve been built.

precious

**prepare()**
Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)
Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

**push_to_cache()**
Try to push a node into a cache

read()
Return the value. If necessary, the value is built.

ref_count

**release_target_info()**
Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()

remove()
Remove this Node: no-op by default.

**render_include_tree()**
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.
reset_executor()
Remove cached executor; forces recompute when needed.

retrieve_from_cache()
Try to retrieve the node's content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists()
Does this node exist locally or in a repository?

scan()
Scan this node's dependents for implicit dependencies.

scanner_key()

select_scanner(scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don't select one the Scanner.Selector that's configured for the target.

set_always_build(always_build=1)
Set the Node's always_build value.

set_executor(executor)
Set the action executor for this node.

set_explicit(is_explicit)

set_nocache(nocache=1)
Set the Node's nocache value.

set_noclean(noclean=1)
Set the Node's noclean value.

set_precious(precious=1)
Set the Node's precious value.

set_pseudo(pseudo=True)
Set the Node's precious value.

set_specific_source(source)

set_state(state)

side_effect

side_effects

sources

sources_set

state

store_info

str_for_display()

target_peers
visited()
   Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

write(built_value)
   Set the value of the node.

str_to_node(s)

update(node)

SCons.Node.Python.ValueWithMemo(value, built_value=None, name=None)
   Memoized Value() node factory.
The Node package for the SCons software construction utility.

This is, in many ways, the heart of SCons.

A Node is where we encapsulate all of the dependency information about any thing that SCons can build, or about any thing which SCons can use to build some other thing. The canonical “thing,” of course, is a file, but a Node can also represent something remote (like a web page) or something completely abstract (like an Alias).

Each specific type of “thing” is specifically represented by a subclass of the Node base class: Node.FS.File for files, Node.Alias for aliases, etc. Dependency information is kept here in the base class, and information specific to files/aliases/etc. is in the subclass. The goal, if we’ve done this correctly, is that any type of “thing” should be able to depend on any other type of “thing.”

```
SCons.Node.Annotate(node)
```

```python
class SCons.Node.BuildInfoBase:
    Bases: object
    The generic base class for build information for a Node.
    This is what gets stored in a .sconsign file for each target file. It contains a NodeInfo instance for this node (signature information that’s specific to the type of Node) and direct attributes for the generic build stuff we have to track: sources, explicit dependencies, implicit dependencies, and action information.

    bact
    bactsig
    bdepends
    bdependsgigs
    bimplicit
    bimplicitsigs
    bsources
    bsourcesigs
    current_version_id = 2

    merge(other)
    Merge the fields of another object into this object. Already existing information is overwritten by the other instance's data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

class SCons.Node.Node:
    Bases: object
    The base Node class, for entities that we know how to build, or use to build other Nodes.

class Attrs:
    Bases: object
    shared

BuildInfo
    alias of SCons.Node.BuildInfoBase

Decider (function)
    GetTag(key)
    Return a user-defined tag.
NodeInfo
   alias of SCons.Node.NodeInfoBase

Tag (key, value)
   Add a user-defined tag.

   _add_child (collection, set, child)
      Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

   _children_get ()
   _children_reset ()
   _func_exists
   _func_get_contents
   _func_is_derived
   _func_rexists
   _func_target_from_source
   _get.Scanner (env, initial.Scanner, root.Scanner, kw)
   _memo
   _specific.sources
   _tags

   add_dependency (depend)
      Adds dependencies.

   add_ignore (depend)
      Adds dependencies to ignore.

   add_prerequisite (prerequisite)
      Adds prerequisites

   add_source (source)
      Adds sources.

   add_to_implicit (deps)

   add_to_waiting_parents (node)
      Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don’t think you can “clean up” this function by using True and False instead…)

   add_to_waiting_s_e (node)

   add_wkid (wkid)
      Add a node to the list of kids waiting to be evaluated

   all_children (scan=1)
      Return a list of all the node’s direct children.

   alter_targets ()
      Return a list of alternate targets for this Node.
always_build
attributes
binfo

build(**kw)
Actually build the node.
This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

builder

builder_set (builder)

built()
Called just after this node is successfully built.

cached
cached (node=None, allowcache=False)
Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

check_attributes (name)
Simple API to check if the node.attributes for name has been set

children (scan=1)
Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date()
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

clear()
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

clear_memoized_values()

del_binfo()
Delete the build info from this node.

depends
depends_set
disambiguate (must_exist=None)
env

env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

get_abspath ()
    Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a concept of relative path, this might return something different.

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env ()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Fetch the contents of the entry.

get_csig ()

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be scanned for implicit dependencies.
get_implicit_deps (env, initial_scanner, path_func, kw={})

Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
scanner, if the scanner’s recursive flag says that we should.

get_ninfo ()

get_source_scanner (node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
This is a convenience function designed primarily to be used in command generators (i.e.,
CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
argument that is nonzero if the command generator is being called to generate a signature for the command
line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a
string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy ()
This method is expected to return an object that will function exactly like this Node, except that it implements any
additional special features that we would like to be in effect for Environment variable substitution. The principle
use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
method to return self if no new functionality is needed for Environment substitution.

get_suffix ()

get_target_scanner ()

has_builder ()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if
node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

has_explicit_builder ()
Return whether this Node has an explicit builder
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an
explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes
is_conftest()
Returns true if this node is an conftest node

is_derived()
Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and
should contribute their build signatures when they are used as source files to other derived files. For example:
source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()
Returns true if this node is an sconscript

is_up_to_date()
Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will
always get built.

linked

make_ready()
Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a
Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if
node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

new_binfo()

new_ninfo()

ninfo

nocache

noclean

postprocess()
Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and
initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the
targets built by a specific action.)
Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()
Try to push a node into a cache

ref_count

release_target_info()
Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()

remove()
Remove this Node: no-op by default.

render_include_tree()
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

reset_executor()
Remove cached executor; forces recompute when needed.

retrieve_from_cache()
Try to retrieve the node’s content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists()
Does this node exist locally or in a repository?

scan()
Scan this node’s dependents for implicit dependencies.

scanner_key()

select_scanner(scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build(always_build=1)
Set the Node’s always_build value.

set_executor(executor)
Set the action executor for this node.

set_explicit(is_explicit)

set_nocache(nocache=1)
Set the Node’s nocache value.

set_noclean(noclean=1)
Set the Node’s noclean value.
set_precious(precious=1)
   Set the Node’s precious value.

set_pseudo(pseudo=True)
   Set the Node’s precious value.

set_specific_source(source)

set_state(state)

side_effect

side_effects

sources

sources_set

state

store_info

target_peers

visited()
   Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.NodeInfoBase
   Bases: object
   The generic base class for signature information for a Node.
   Node subclasses should subclass NodeInfoBase to provide their own logic for dealing with their own Node-specific
   signature information.

   convert(node, val)

   current_version_id = 2

   format(field_list=None, names=0)

   merge(other)
      Merge the fields of another object into this object. Already existing information is overwritten by the other
      instance’s data. WARNING: If a ‘__dict__’ slot is added, it should be updated instead of replaced.

   update(node)

class SCons.Node.NodeList(initlist=None)
   Bases: collections.UserList

   _abc_impl = <abc_data object>

   append(item)
      S.append(value) – append value to the end of the sequence

   clear() → None – remove all items from S
copy ()

count (value) → integer – return number of occurrences of value

extend (other)
S.extend(iterable) – extend sequence by appending elements from the iterable

index(value[, start[, stop]]) → integer – return first index of value.
Raises ValueError if the value is not present.
Supporting start and stop arguments is optional, but recommended.

insert (i, item)
S.insert(index, value) – insert value before index

pop (i) → item – remove and return item at index (default last).
Raise IndexError if list is empty or index is out of range.

remove (item)
S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
S.reverse() – reverse IN PLACE

sort (*args, **kwds)

class SCons.Node.Walker (node, kids_func=<function get_children>, cycle_func=<function ignore_cycle>, eval_func=<function do_nothing>)
Bases: object
An iterator for walking a Node tree.
This is depth-first, children are visited before the parent. The Walker object can be initialized with any node, and
returns the next node on the descent with each get_next() call. get the children of a node instead of calling
‘children’. ‘cycle_func’ is an optional function that will be called when a cycle is detected.
This class does not get caught in node cycles caused, for example, by C header file include loops.

get_next ()
Return the next node for this walk of the tree.
This function is intentionally iterative, not recursive, to sidestep any issues of stack size limitations.

is_done ()
SCons.Node.changed_since_last_build_alias (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_entry (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_node (node, target, prev_ni, repo_node=None)
Must be overridden in a specific subclass to return True if this Node (a dependency) has changed since the last
time it was used to build the specified target. prev_ni is this Node’s state (for example, its file timestamp, length,
maybe content signature) as of the last time the target was built.
Note that this method is called through the dependency, not the target, because a dependency Node must be able
to use its own logic to decide if it changed. For example, File Nodes need to obey if we’re configured to use
timestamps, but Python Value Nodes never use timestamps and always use the content. If this method were
called through the target, then each Node’s implementation of this method would have to have more complicated
logic to handle all the different Node types on which it might depend.
SCons.Node.changed_since_last_build_python (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_state_changed (node, target, prev_ni, repo_node=None)
SCons.Node.classname (obj)
SCons.Node.decide_source (node, target, prev_ni, repo_node=None)
SCons.Node.decide_target (node, target, prev_ni, repo_node=None)
SCons.Node.do_nothing (node, parent)
SCons.Node\._do\._nothing\._node\. (node)
SCons.Node\._exists\._always\. (node)
SCons.Node\._exists\._base\. (node)
SCons.Node\._exists\._entry\. (node)
    Return if the Entry exists. Check the file system to see what we should turn into first. Assume a file if there's no directory.
SCons.Node\._exists\._file\. (node)
SCons.Node\._exists\._none\. (node)
SCons.Node\._get\._children\. (node, parent)
SCons.Node\._get\._contents\._dir\. (node)
    Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are sorted.
SCons.Node\._get\._contents\._entry\. (node)
    Fetch the contents of the entry. Returns the exact binary contents of the file.
SCons.Node\._get\._contents\._file\. (node)
SCons.Node\._get\._contents\._none\. (node)
SCons.Node\._ignore\._cycle\. (node, stack)
SCons.Node\._is\._derived\._node\. (node)
    Returns true if this node is derived (i.e. built).
SCons.Node\._is\._derived\._none\. (node)
SCons.Node\._rexists\._base\. (node)
SCons.Node\._rexists\._node\. (node)
SCons.Node\._rexists\._none\. (node)
SCons.Node\._store\._info\._file\. (node)
SCons.Node\._store\._info\._pass\. (node)
SCons.Node\._target\._from\._source\._base\. (node, prefix, suffix, splitext)
SCons.Node\._target\._from\._source\._none\. (node, prefix, suffix, splitext)

**SCons.Platform package**

**Submodules**

**SCons.Platform.aix module**

Platform-specific initialization for IBM AIX systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.
SCons.Platform.aix\._generate\.(env)
SCons.Platform.aix\._get\._xlc\.(env, xlc=None, packages=[])

**SCons.Platform.cygwin module**

Platform-specific initialization for Cygwin systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.
SCons.Platform.cygwin\._generate\.(env)
SCons Platform API Documentation

**SCons.Platform.darwin module**

Platform-specific initialization for Mac OS X systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.darwin.generate(env)

**SCons.Platform.hpux module**

Platform-specific initialization for HP-UX systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.hpux.generate(env)

**SCons.Platform.irix module**

Platform-specific initialization for SGI IRIX systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.irix.generate(env)

**SCons.Platform.mingw module**

Platform-specific initialization for the MinGW system.

**SCons.Platform.os2 module**

Platform-specific initialization for OS/2 systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.os2.generate(env)

**SCons.Platform.posix module**

Platform-specific initialization for POSIX (Linux, UNIX, etc.) systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.posix.escape(arg)

escape shell special characters

SCons.Platform.posix.exec_popen3(l, env, stdout, stderr)

SCons.Platform.posix.exec_subprocess(l, env)

SCons.Platform.posix.generate(env)

SCons.Platform.posix.piped_env_spawn(sh, escape, cmd, args, env, stdout, stderr)

SCons.Platform.posix.subprocess_spawn(sh, escape, cmd, args, env)

**SCons.Platform.sunos module**

Platform-specific initialization for Sun systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

SCons.Platform.sunos.generate(env)
**SCons.Platform.virtualenv module**

“Platform” support for a Python virtualenv.

SCons.Platform.virtualenv.\ImportVirtualenv \(\text{env}\)

Copies virtualenv-related environment variables from OS environment to \(\text{env}['\text{ENV}']\) and prepends virtualenv’s PATH to \(\text{env}['\text{ENV}'][\text{PATH}]\).

SCons.Platform.virtualenv.IsInVirtualenv \(\text{path}\)

Returns True, if \(\text{path}\) is under virtualenv’s home directory. If not, or if we don’t use virtualenv, returns False.

SCons.Platform.virtualenv.Virtualenv()

Returns path to the virtualenv home if scons is executing within a virtualenv or None, if not.

SCons.Platform.virtualenv._enable_virtualenv_default()

SCons.Platform.virtualenv._ignore_virtualenv_default()

SCons.Platform.virtualenv._inject_venv_path \(\text{env}, \text{path}_\text{list}=$\text{None}$\)

Modify environment such that SCons will take into account its virtualenv when running external tools.

SCons.Platform.virtualenv._inject_venv_variables \(\text{env}\)

SCons.Platform.virtualenv._is_path_in \(\text{path}, \text{base}\)

Returns true if \(\text{path}\) is located under the \(\text{base}\) directory.

SCons.Platform.virtualenv._running_in_virtualenv()

Returns True if scons is executed within a virtualenv

SCons.Platform.virtualenv.select_paths_in_venv \(\text{path}_\text{list}\)

Returns a list of paths from \(\text{path}_\text{list}\) which are under virtualenv’s home directory.

**SCons.Platform.win32 module**

Platform-specific initialization for Win32 systems.

There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

**class** SCons.Platform.win32.ArchDefinition \(\text{arch}, \text{synonyms}=[\text{]}\)

Bases: **object**

Determine which windows CPU were running on. A class for defining architecture-specific settings and logic.

SCons.Platform.win32.escape \(\text{x}\)

SCons.Platform.win32.exec_spawn \(\text{l}, \text{env}\)

SCons.Platform.win32.generate \(\text{env}\)

SCons.Platform.win32.get_architecture \(\text{arch}=\text{None}\)

Returns the definition for the specified architecture string.

If no string is specified, the system default is returned (as defined by the PROCESSOR_ARCHITEW6432 or PROCESSOR_ARCHITECTURE environment variables).

SCons.Platform.win32.get_program_files_dir()

Get the location of the program files directory

SCons.Platform.win32.get_system_root()

SCons.Platform.win32.piped_spawn \(\text{sh}, \text{escape}, \text{cmd}, \text{args}, \text{env}, \text{stdout}, \text{stderr}\)

SCons.Platform.win32.spawn \(\text{sh}, \text{escape}, \text{cmd}, \text{args}, \text{env}\)

SCons.Platform.win32.spawnve \(\text{mode}, \text{file}, \text{args}, \text{env}\)

**Module contents**

SCons platform selection.

Looks for modules that define a callable object that can modify a construction environment as appropriate for a given platform.
Note that we take a more simplistic view of “platform” than Python does. We’re looking for a single string that determines a set of tool-independent variables with which to initialize a construction environment. Consequently, we’ll examine both sys.platform and os.name (and anything else that might come in to play) in order to return some specification which is unique enough for our purposes.

Note that because this subsystem just selects a callable that can modify a construction environment, it’s possible for people to define their own “platform specification” in an arbitrary callable function. No one needs to use or tie in to this subsystem in order to roll their own platform definition.

```python
SCons.Platform.DefaultToolList (platform, env)
    Select a default tool list for the specified platform.
```

```python
SCons.Platform.Platform (name='darwin')
    Select a canned Platform specification.
```

```python
class SCons.Platform.PlatformSpec (name, generate)
    Bases: object
```

```python
class SCons.Platform.TempFileMunge (cmd, cmdstr=None)
    Bases: object
    Convert long command lines to use a temporary file.
    You can set an Environment variable (usually TEMPFILE) to this, then call it with a string argument, and it will perform temporary file substitution on it. This is used to circumvent limitations on the length of command lines. Example:
    ```python
    env['TEMPFILE'] = TempFileMunge
    env['LINKCOM'] = "${TEMPFILE('LINK $TARGET $SOURCES','$LINKCOMSTR')}"
    ```
    By default, the name of the temporary file used begins with a prefix of `@`. This may be configured for other tool chains by setting the TEMPFILEPREFIX variable. Example:
    ```python
    env['TEMPFILEPREFIX'] = '-@'       # diab compiler
    env['TEMPFILEPREFIX'] = '-via'     # arm tool chain
    env['TEMPFILEPREFIX'] = ''        # (the empty string) PC Lint
    ```
    You can configure the extension of the temporary file through the TEMPFILESUFFIX variable, which defaults to `.link` (see comments in the code below). Example:
    ```python
    env['TEMPFILESUFFIX'] = '.lnt'    # PC Lint
    ```
    Entries in the temporary file are separated by the value of the TEMPFILERARGJOIN variable, which defaults to an OS-appropriate value.
    A default argument escape function is SCons.Subst.quote_spaces. If you need to apply extra operations on a command argument before writing to a temporary file(fix Windows slashes, normalize paths, etc.), please set TEMPFILERARGESCFUNC variable to a custom function. Example:
    ```python
    import sys
    import re
    from SCons.Subst import quote_spaces
    WINPATHSEP_RE = re.compile(r'\([^"\]'\] |$)"
    def tempfile_arg_esc_func(arg):
        arg = quote_spaces(arg)
        if sys.platform != "win32":
            return arg
        # GCC requires double Windows slashes, let's use UNIX separator
        return WINPATHSEP_RE.sub(r'\/\", arg)
    env['TEMPFILEARGESCFUNC'] = tempfile_arg_esc_func
    ```
```
SCons.Platform.platform_default()
Return the platform string for our execution environment.
The returned value should map to one of the SCons/Platform/*.py files. Since scons is architecture independent, though, we don’t care about the machine architecture.

SCons.Platform.platform_module(name='darwin')
Return the imported module for the platform.
This looks for a module name that matches the specified argument. If the name is unspecified, we fetch the appropriate default for our execution environment.

**SCons.Scanner package**

**Submodules**

**SCons.Scanner.C module**
Dependency scanner for C/C++ code.

SCons.Scanner.C.CConditionalScanner()
Return an advanced conditional Scanner instance for scanning source files
Interprets C/C++ Preprocessor conditional syntax (#ifdef, #if, defined, #else, #elif, etc.).

SCons.Scanner.C.CScanner()
Return a prototype Scanner instance for scanning source files that use the C pre-processor

class SCons.Scanner.C.SConsCPPConditionalScanner(*args, **kw)
    Bases: SCons.cpp.PreProcessor
SCons-specific subclass of the cpp.py module’s processing.
We subclass this so that: 1) we can deal with files represented by Nodes, not strings; 2) we can keep track of the files that are missing.

    _do_if_else_condition(condition)
    Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

    _match_tuples(tuples)

    _parse_tuples(contents)

    _process_tuples(tuples, file=None)

    all_include(t)

    do_define(t)
    Default handling of a #define line.

    do_elif(t)
    Default handling of a #elif line.

    do_else(t)
    Default handling of a #else line.

    do_endif(t)
    Default handling of a #endif line.

    do_if(t)
    Default handling of a #if line.

    do_ifdef(t)
    Default handling of a #ifdef line.

    do ifndef(t)
Default handling of a `#ifndef` line.

```python
do_import ()
```
Default handling of a `#import` line.

```python
do_include ()
```
Default handling of a `#include` line.

```python
do_include_next ()
```
Default handling of a `#include` line.

```python
do_nothing ()
```
Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

```python
do_UNDEF ()
```
Default handling of a `#undef` line.

```python
eval_expression ()
```
Evaluates a C preprocessor expression. This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track `#define` values.

```python
finalize_result (fname)
```

```python
find_include_file ()
```
Finds the `#include` file for a given preprocessor tuple.

```python
initialize_result (fname)
```

```python
process_contents (contents)
```
Pre-processes a file contents. Is used by tests

```python
process_file (file)
```
Pre-processes a file. This is the main internal entry point.

```python
read_file (file)
```

```python
resolve_include ()
```
Resolve a tuple-ized `#include` line. This handles recursive expansion of values without "" or <> surrounding the name until an initial " " or < is found, to handle `#include FILE` where FILE is a `#define` somewhere else.

```python
restore ()
```
Pops the previous dispatch table off the stack and makes it the current one.

```python
save ()
```
Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

```python
SCons_CURRENT_FILE ()
```

```python
start_handling_includes (t=None)
```
Causes the PreProcessor object to start processing `#import`, `#include` and `#include_next` lines. This method will be called when a `#if`, `#ifdef`, `#ifndef` or `#elif` evaluates True, or when we reach the `#else` in a `#if`, `#ifdef`, `#ifndef` or `#elif` block where a condition already evaluated False.

```python
stop_handling_includes (t=None)
```
Causes the PreProcessor object to stop processing `#import`, `#include` and `#include_next` lines. This method will be called when a `#if`, `#ifdef`, `#ifndef` or `#elif` evaluates False, or when we reach the `#else` in a `#if`, `#ifdef`, `#ifndef` or `#elif` block where a condition already evaluated True.
tupleize (contents)
    Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file.
    The first element of each tuple is the line's preprocessor directive (#if, #include, #define, etc., minus the initial
    `#`). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.

class SCons.Scanner.C.SConsCPPConditionalScannerWrapper (name, variable)
    Bases: object
    The SCons wrapper around a cpp.py scanner.
    This is the actual glue between the calling conventions of generic SCons scanners, and the (subclass of) cpp.py
    class that knows how to look for #include lines with reasonably real C-preprocessor-like evaluation of
    #if/#ifdef/#else/#elif lines.

    recurse_nodes (nodes)

    select (node)

class SCons.Scanner.C.SConsCPPScanner (*args, **kw)
    Bases: SCons.cpp.PreProcessor
    SCons-specific subclass of the cpp.py module's processing.
    We subclass this so that: 1) we can deal with files represented by Nodes, not strings; 2) we can keep track of the
    files that are missing.

    _do_if_else_condition (condition)
        Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

    _match_tuples (tuples)

    _parse_tuples (contents)

    _process_tuples (tuples, file=None)

    all_include ()

    do_define ()
        Default handling of a #define line.

    do_elif ()
        Default handling of a #elif line.

    do_else ()
        Default handling of a #else line.

    do endif ()
        Default handling of a #endif line.

    do_if ()
        Default handling of a #if line.

    doifdef ()
        Default handling of a #ifdef line.

    doifndef ()
        Default handling of a #ifndef line.

    do_import ()
        Default handling of a #import line.

    do_include ()
        Default handling of a #include line.

    do_include_next ()
Default handling of a `#include` line.

**do_nothing** (!)
Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

**do_undef** (!)
Default handling of a `#undef` line.

**eval_expression** (!)
Evaluates a C preprocessor expression.
This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track #define values.

**finalize_result** (fname)

**find_include_file** (!)
Finds the `#include` file for a given preprocessor tuple.

**initialize_result** (fname)

**process_contents** (contents)
Pre-processes a file contents.
Is used by tests

**process_file** (file)
Pre-processes a file.
This is the main internal entry point.

**read_file** (file)

**resolve_include** (!)
Resolve a tuple-ized `#include` line.
This handles recursive expansion of values without "" or <> surrounding the name until an initial "" or < is found, to handle `#include FILE` where FILE is a `#define` somewhere else.

**restore** ()
Pops the previous dispatch table off the stack and makes it the current one.

**save** ()
Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

**scons_current_file** ()

**start_handling_includes** (l=none)
Causes the PreProcessor object to start processing `#import`, `#include` and `#include_next` lines.
This method will be called when a `#if`, `#ifdef`, `#ifndef` or `#elif` evaluates True, or when we reach the `#else` in a `#if`, `#ifdef`, `#ifndef` or `#elif` block where a condition already evaluated False.

**stop_handling_includes** (l=none)
Causes the PreProcessor object to stop processing `#import`, `#include` and `#include_next` lines.
This method will be called when a `#if`, `#ifdef`, `#ifndef` or `#elif` evaluates False, or when we reach the `#else` in a `#if`, `#ifdef`, `#ifndef` or `#elif` block where a condition already evaluated True.

**tupleize** (contents)
Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file.
The first element of each tuple is the line's preprocessor directive (`#if`, `#include`, `#define`, etc., minus the initial `#`). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.

class SCons.Scanner.C.SConsCPPScannerWrapper (name, variable)
Bases: object
The SCons wrapper around a cpp.py scanner.
This is the actual glue between the calling conventions of generic SCons scanners, and the (subclass of) cpp.py class that knows how to look for #include lines with reasonably real C-preprocessor-like evaluation of #if/#ifdef/#else/#elif lines.

```python
recurse_nodes (nodes)
```

```python
select (node)
```

SCons.Scanner.D.dictify_CPPDEFINES (env)

---

### SCons.Scanner.D module

Scanner for the Digital Mars “D” programming language.

Coded by Andy Friesen, 17 Nov 2003

```python
class SCons.Scanner.D.D
    Bases: SCons.Scanner.Classic

    _recurse_all_nodes (nodes)

    _recurse_no_nodes (nodes)

    add_scanner (skey, scanner)

    add_skey (skey)
        Add a skey to the list of skeys

    find_include (include, source_dir, path)

    find_include_names (node)

    get_skeys (env=None)

    path (env, dir=None, target=None, source=None)

    scan (node, path=())

    select (node)

    sort_key (include)
```

SCons.Scanner.D.DScanner ()

Return a prototype Scanner instance for scanning D source files

---

### SCons.Scanner.Dir module

SCons.Scanner.Dir.DirEntryScanner (**kw)

Return a prototype Scanner instance for “scanning” directory Nodes for their in-memory entries

SCons.Scanner.Dir.DirScanner (**kw)

Return a prototype Scanner instance for scanning directories for on-disk files

SCons.Scanner.Dir.do_not_scan (k)

SCons.Scanner.Dir.only_dirs (nodes)

SCons.Scanner.Dir.scan_in_memory (node, env, path=())

“Scans” a Node.FS.Dir for its in-memory entries.

SCons.Scanner.Dir.scan_on_disk (node, env, path=())

Scans a directory for on-disk files and directories therein.

Looking up the entries will add these to the in-memory Node tree representation of the file system, so all we have to do is just that and then call the in-memory scanning function.
SCons.Scanner.Fortran module

Dependency scanner for Fortran code.

```python
class SCons.Scanner.Fortran.F90Scanner (name, suffixes, path_variable, use_regex, incl_regex, def_regex, *args, **kw):
    Bases: SCons.Scanner.Classic
    A Classic Scanner subclass for Fortran source files which takes into account both USE and INCLUDE statements. This scanner will work for both F77 and F90 (and beyond) compilers.
    Currently, this scanner assumes that the include files do not contain USE statements. To enable the ability to deal with USE statements in include files, add logic right after the module names are found to loop over each include file, search for and locate each USE statement, and append each module name to the list of dependencies. Caching the search results in a common dictionary somewhere so that the same include file is not searched multiple times would be a smart thing to do.

    _recurse_all_nodes (nodes)
    _recurse_no_nodes (nodes)
    add_scanner (skey, scanner)
    add_skey (skey)
        Add a skey to the list of skeys
    find_include (include, source_dir, path)
    find_include_names (node)
    get_skeys (env=None)
    path (env, dir=None, target=None, source=None)
    scan (node, env, path=())
    select (node)
    sort_key (include)
```

SCons.Scanner.Fortran.FortranScan (path_variable='FORTRANPATH')

Return a prototype Scanner instance for scanning source files for Fortran USE & INCLUDE statements

SCons.Scanner.IDL module

Dependency scanner for IDL (Interface Definition Language) files.

```python
SCons.Scanner.IDL.IDLScan ()
    Return a prototype Scanner instance for scanning IDL source files
```

SCons.Scanner.LaTeX module

Dependency scanner for LaTeX code.

```python
class SCons.Scanner.LaTeX.FindENVPathDirs (variable)
    Bases: object
    A class to bind a specific E(*)PATH variable name to a function that will return all of the E(*)path directories.

class SCons.Scanner.LaTeX.LaTeX (name, suffixes, graphics_extensions, *args, **kw)
    Bases: SCons.Scanner.Base
    Class for scanning LaTeX files for included files.
    Unlike most scanners, which use regular expressions that just return the included file name, this returns a tuple consisting of the keyword for the inclusion ("include", "includegraphics", "input", or "bibliography"), and then the file name itself. Based on a quick look at LaTeX documentation, it seems that we should append .tex suffix for the
```
“include” keywords, append .tex if there is no extension for the “input” keyword, and need to add .bib for the “bibliography” keyword that does not accept extensions by itself. Finally, if there is no extension for an “includegraphics” keyword latex will append .ps or .eps to find the file, while pdftex may use .pdf, .jpg, .tif, .mps, or .png. The actual subset and search order may be altered by DeclareGraphicsExtensions command. This complication is ignored. The default order corresponds to experimentation with teTeX:

```
$ latex --version
pdfeTeX 3.141592-1.21a-2.2 (Web2C 7.5.4)
kpathsea version 3.5.4
```

The order is:

- [‘.eps’, ‘.ps’] for latex
- [‘.png’, ‘.pdf’, ‘.jpg’, ‘.tif’] for pdftex

Another difference is that the search path is determined by the type of the file being searched: env[‘TEXINPUTS’] for “input” and “include” keywords env[‘TEXINPUTS’] for “includegraphics” keyword env[‘TEXINPUTS’] for “listinputlisting” keyword env[‘BIBINPUTS’] for “bibliography” keyword env[‘BSTINPUTS’] for “bibliographystyle” keyword env[‘INDEXSTYLE’] for “makeindex” keyword, no scanning support needed just allows user to set it if needed.

FIXME: also look for the class or style in document[|class|style|] FIXME: also look for the argument of bibliographystyle()}

```latex_names```
```
include_type, filename
```

```recurse_all_nodes```
```
(nodes)
```

```recurse_no_nodes```
```
(nodes)
```

```add_scanner```
```
(skey, scanner)
```

```add_skey```
```
(skey)
```

Add a skey to the list of skeys

```canonical_text```
```
(text)
```

Standardize an input TeX-file contents.

**Currently:**

- removes comments, unwrapping comment-wrapped lines.

```env_variables```
```
[‘TEXINPUTS’, ‘BIBINPUTS’, ‘BSTINPUTS’, ‘INDEXSTYLE’]
```

```find_include```
```
(include, source_dir, path)
```

```get_skeys```
```
(env=None)
```

```keyword_paths```
```
```

```path```
```
(env, dir=None, target=None, source=None)
```

```scan```
```
(node, subdir=’.’)
```

```scan_recurse```
```
(node, path=())
```

do a recursive scan of the top level target file This lets us search for included files based on the directory of the main file just as latex does

```select```
```
(node)
```

```sort_key```
```
(include)
```
two_arg_commands = ['import', 'subimport', 'includelfrom', 'subincludelfrom', 'inputfrom', 'subinputfrom']

SCons.Scanner.LaTeX.LaTeXScanner()  
Return a prototype Scanner instance for scanning LaTeX source files when built with latex.

SCons.Scanner.LaTeX.PDFLaTeXScanner()  
Return a prototype Scanner instance for scanning LaTeX source files when built with pdflatex.

class SCons.Scanner.LaTeX._Null
    Bases: object

SCons.Scanner.LaTeX._null  
alias of SCons.Scanner.LaTeX._Null

SCons.Scanner.LaTeX.modify_env_var(env, var, abspath)

---

SCons.Scanner.Prog module

Dependency scanner for program files.

SCons.Scanner.Prog.ProgramScanner(**kw)  
Return a prototype Scanner instance for scanning executable files for static-lib dependencies

SCons.Scanner.Prog._subst_libs(env, libs)  
Substitute environment variables and split into list.

SCons.Scanner.Prog.scan(node, env, libpath=())  
Scans program files for static-library dependencies.
It will search the LIBPATH environment variable for libraries specified in the LIBS variable, returning any files it finds as dependencies.

---

SCons.Scanner.RC module

Dependency scanner for RC (Interface Definition Language) files.

SCons.Scanner.RC.RCScan()  
Return a prototype Scanner instance for scanning RC source files

SCons.Scanner.RC.no_tlb(nodes)  
Filter out .tlb files as they are binary and shouldn’t be scanned.

---

SCons.Scanner.SWIG module

Dependency scanner for SWIG code.

SCons.Scanner.SWIG.SWIGScanner()  

---

Module contents

The Scanner package for the SCons software construction utility.

class SCons.Scanner.Base (function, name='NONE', argument=<class 'SCons.Scanner._Null'>, skkey=<class 'SCons.Scanner._Null'>, path_function=None, node_class=<class 'SCons.Node.FS.Base'>, node_factory=None, scan_check=None, recursive=None)
    Bases: object

Base class for dependency scanners.
This implements straightforward, single-pass scanning of a single file.

    _recurse_all_nodes(nodes)

    _recurse_no_nodes(nodes)

    add_scanner(skey, scanner)

    add_skey(skey)
Add a skey to the list of skeys

get_skeys (env=None)

path (env, dir=None, target=None, source=None)

select (node)

class SCons.Scanner.Classic (name, suffixes, path_variable, regex, *args, **kw)
Bases: SCons.Scanner.Current
A Scanner subclass to contain the common logic for classic CPP-style include scanning, but which can be customized to use different regular expressions to find the includes.
Note that in order for this to work “out of the box” (without overriding the find_include() and sort_key() methods), the regular expression passed to the constructor must return the name of the include file in group 0.

_recurse_all_nodes (nodes)

_recurse_no_nodes (nodes)

add_scanner (skey, scanner)

add_skey (skey)
Add a skey to the list of skeys

find_include (include, source_dir, path)

find_include_names (node)

get_skeys (env=None)

path (env, dir=None, target=None, source=None)

scan (node, path=())

select (node)

sort_key (include)

class SCons.Scanner.ClassicCPP (name, suffixes, path_variable, regex, *args, **kw)
Bases: SCons.Scanner.Classic
A Classic Scanner subclass which takes into account the type of bracketing used to include the file, and uses classic CPP rules for searching for the files based on the bracketing.
Note that in order for this to work, the regular expression passed to the constructor must return the leading bracket in group 0, and the contained filename in group 1.

_recurse_all_nodes (nodes)

_recurse_no_nodes (nodes)

add_scanner (skey, scanner)

add_skey (skey)
Add a skey to the list of skeys

find_include (include, source_dir, path)

find_include_names (node)

get_skeys (env=None)

path (env, dir=None, target=None, source=None)
SCons Project API Documentation

scan (node, path=())

select (node)

sort_key (include)

class SCons.Scanner.Current (*args, **kw)
Bases: SCons.Scanner.Base
A class for scanning files that are source files (have no builder) or are derived files and are current (which implies that they exist, either locally or in a repository).

_recurse_all_nodes (nodes)

_recurse_no_nodes (nodes)

add_scanner (skey, scanner)

add_skey (skey)
    Add a skey to the list of skeys

get_skeys (env=None)

path (env, dir=None, target=None, source=None)

select (node)

class SCons.Scanner.FindPathDirs (variable)
Bases: object
Class to bind a specific E(*PATH variable name to a function that will return all of the E(*PATH directories.

SCons.Scanner.Scanner (function, *args, **kw)
Factory function to create a Scanner Object.
Creates the appropriate Scanner based on the type of “function”.
TODO: Deprecate this some day. We’ve moved the functionality inside the Base class and really don’t need this factory function any more. It was, however, used by some of our Tool modules, so the call probably ended up in various people’s custom modules patterned on SCons code.

class SCons.Scanner.Selector (dict, *args, **kw)
Bases: SCons.Scanner.Base
A class for selecting a more specific scanner based on the scanner_key() (suffix) for a specific Node.
TODO: This functionality has been moved into the inner workings of the Base class, and this class will be deprecated at some point. (It was never exposed directly as part of the public interface, although it is used by the Scanner() factory function that was used by various Tool modules and therefore was likely a template for custom modules that may be out there.)

_recurse_all_nodes (nodes)

_recurse_no_nodes (nodes)

add_scanner (skey, scanner)

add_skey (skey)
    Add a skey to the list of skeys

get_skeys (env=None)

path (env, dir=None, target=None, source=None)

select (node)

class SCons.Scanner._Null
Bases: `object`

`SCons.Scanner._null` alias of `SCons.Scanner._Null`

### SCons.Script package

#### Submodules

### SCons.Script.Interactive module

SCons interactive mode.

class `SCons.Script.Interactive.SConsInteractiveCmd (**kw)`

Bases: `cmd.Cmd`

Build [TARGETS] Build the specified TARGETS and their dependencies. 'b' is a synonym. `clean` [TARGETS] Clean (remove) the specified TARGETS and their dependencies. 'c' is a synonym. `exit` Exit SCons interactive mode. `help` [COMMAND] Prints help for the specified COMMAND. 'h' and '?' are synonyms. `shell` [COMMANDLINE] Execute COMMANDLINE in a subshell. 'sh' and '!' are synonyms. `version` Prints SCons version information.

_..._do_one_help (arg)

_do_doc_to_help (obj)

_strip_initial_spaces (s)

`cmdloop` (intro=None)

Repeatedly issue a prompt, accept input, parse an initial prefix off the received input, and dispatch to action methods, passing them the remainder of the line as argument.

`columnize` (list, displaywidth=80)

Display a list of strings as a compact set of columns. Each column is only as wide as necessary. Columns are separated by two spaces (one was not legible enough).

`complete` (text, state)

Return the next possible completion for 'text'. If a command has not been entered, then complete against command list. Otherwise try to call complete_<command> to get list of completions.

`complete_help` (*args)

`completedefault` (*ignored)

Method called to complete an input line when no command-specific complete_*() method is available. By default, it returns an empty list.

`completenames` (text, *ignored)

`default` (argv)

Called on an input line when the command prefix is not recognized. If this method is not overridden, it prints an error message and returns.

`do_EOF` (argv)

`do_build` (argv)

Build [TARGETS] Build the specified TARGETS and their dependencies. 'b' is a synonym.

`do_clean` (argv)

Clean (remove) the specified TARGETS and their dependencies. 'c' is a synonym.
do_exit (argv)
exit Exit SCons interactive mode.

do_help (argv)
help [COMMAND] Prints help for the specified COMMAND. ‘h’ and ‘?’ are synonyms.

do_shell (argv)
shell [COMMANDLINE] Execute COMMANDLINE in a subshell. ‘sh’ and ‘!’ are synonyms.

do_version (argv)
version Prints SCons version information.

doc_header = 'Documented commands (type help <topic>):'
doc_leader = ''
emptyline ()
Called when an empty line is entered in response to the prompt.
If this method is not overridden, it repeats the last nonempty command entered.

get_names ()

identchars = 'abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789_'

intro = None

lastcmd = ''
misc_header = 'Miscellaneous help topics:'
nohelp = '*** No help on %s'

onecmd (line)
    Interpret the argument as though it had been typed in response to the prompt.
    This may be overridden, but should not normally need to be; see the precmd() and postcmd() methods for useful
    execution hooks. The return value is a flag indicating whether interpretation of commands by the interpreter
    should stop.

parseline (line)
    Parse the line into a command name and a string containing the arguments. Returns a tuple containing
    (command, args, line). ‘command’ and ‘args’ may be None if the line couldn’t be parsed.

postcmd (stop, line)
    Hook method executed just after a command dispatch is finished.

postloop ()
    Hook method executed once when the cmdloop() method is about to return.

precmd (line)
    Hook method executed just before the command line is interpreted, but after the input prompt is generated and
    issued.

preloop ()
    Hook method executed once when the cmdloop() method is called.

print_topics (header, cmds, cmdlen, maxcol)

prompt = '(Cmd) '  
ruler = '='

100
SCons Project API Documentation

```python
synonyms = {'b': 'build', 'c': 'clean', 'h': 'help', 'scons': 'build', 'sh': 'shell'}

undoc_header = 'Undocumented commands:'

use_rawinput = 1
SCons.Script.Interactive.interact(fs, parser, options, targets, target_top)
```

**SCons.Script.Main module**

The main() function used by the `scons` script.

Architecturally, this is the `scons` script, and will likely only be called from the external “scons” wrapper. Consequently, anything here should not be, or be considered, part of the build engine. If it’s something that we expect other software to want to use, it should go in some other module. If it’s specific to the “scons” script invocation, it goes here.

```python
SCons.Script.Main.AddOption(*args, **kw)

class SCons.Script.Main.BuildTask(tm, targets, top, node)
    bases: SCons.Taskmaster.OutOfDateTask
    An SCons build task.

    _abc_impl = <_abc_data object>

    _exception_raise()
    Raises a pending exception that was recorded while getting a Task ready for execution.

    _no_exception_to_raise()

    display(message)
    Hook to allow the calling interface to display a message.
    This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

    do_failed(status=2)

    exc_clear()
    Clears any recorded exception.
    This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

    exc_info()
    Returns info about a recorded exception.

    exception_set(exception=None)
    Records an exception to be raised at the appropriate time.
    This also changes the “exception_raise” attribute to point to the method that will, in fact

    execute()
    Called to execute the task.
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in prepare(), executed() or failed().

    executed()
    Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
    This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.
```
executed_with_callbacks()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_without_callbacks()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the Node’s callback methods.

fail_continue()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Make a task ready for execution

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons -c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Returns True (indicating this Task should be executed) if this Task’s target state indicates it needs executing, which has already been determined by an earlier up-to-date check.

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

trace_message (method, node, description='node')
class SCons.Script.Main.CleanTask (tm, targets, top, node)
Bases: SCons.Taskmaster.AlwaysTask
An SCons clean task.

_clean_impl = <_abc_data object>

_clean_targets (remove=True)

_exception_raise ()
  Raises a pending exception that was recorded while getting a Task ready for execution.

_get_files_to_clean ()

_no_exception_to_raise ()

display (message)
  Hook to allow the calling interface to display a message.
  This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out
  what Node should be built next, the actual target list may be altered, along with a message describing the
  alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see
  those messages.

_exc_clear ()
  Clears any recorded exception.
  This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

_exc_info ()
  Returns info about a recorded exception.

_exception_set (exception=None)
  Records an exception to be raised at the appropriate time.
  This also changes the “exception_raise” attribute to point to the method that will, in fact

_execute ()
  Called to execute the task.
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
  unsafe stuff in prepare(), executed() or failed().

_executed ()
  Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
  Node’s callback methods.

_executed_with_callbacks ()
  Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
  callback methods.
  This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
  deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
  “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
  was an actual built target or a source Node.

_executed_without_callbacks ()
  Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
  Node’s callback methods.

_fail_continue ()
  Explicit continue-the-build failure.
  This sets failure status on the target nodes and all of their dependent parent nodes.
  Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
  up-to-date nodes when using Configure().

_fail_stop ()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

fs_delete(path, pathstr, remove=True)

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons
-c” option.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons
-c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t.
their dependencies) can use this as follows:

class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no
build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a
common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary
directories before the Action is actually called to build the targets.

remove()

show()

trace_message(method, node, description='node')

class SCons.Script.Main.CountStats

do_append(label)

do_nothing(*args, **kw)
do_print()

enable(outfp)

class SCons.Script.Main.FakeOptionParser:
    Bases: object
    A do-nothing option parser, used for the initial OptionsParser variable.
    During normal SCons operation, the OptionsParser is created right away by the main() function. Certain tests
    scripts however, can introspect on different Tool modules, the initialization of which can try to add a new, local
    option to an otherwise uninitialized OptionsParser object. This allows that introspection to happen without blowing
    up.

class FakeOptionValues:
    Bases: object

    add_local_option(*args, **kw)

    values = <SCons.Script.Main.FakeOptionParser.FakeOptionValues object>

SCons.Script.Main.GetBuildFailures()
SCons.Script.Main.GetOption(name)

class SCons.Script.Main.MemStats:

    do_append(label)

    do_nothing(*args, **kw)

    do_print()

    enable(outfp)

SCons.Script.Main.PrintHelp(file=None)
SCons.Script.Main.Progress(*args, **kw)

class SCons.Script.Main.QuestionTask(tm, targets, top, node):
    Bases: SCons.Taskmaster.AlwaysTask
    An SCons task for the -q (question) option.

    __abc_impl = <_abc_data object>
_exception_raise ()
  Raises a pending exception that was recorded while getting a Task ready for execution.

_no_exception_to_raise ()

display (message)
  Hook to allow the calling interface to display a message.
  This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out
  what Node should be built next, the actual target list may be altered, along with a message describing the
  alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see
  those messages.

exc_clear ()
  Clears any recorded exception.
  This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

exc_info ()
  Returns info about a recorded exception.

exception_set (exception=None)
  Records an exception to be raised at the appropriate time.
  This also changes the “exception_raise” attribute to point to the method that will, in fact

execute ()
  Called to execute the task.
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
  unsafe stuff in prepare(), executed() or failed().

executed ()
  Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
  callback methods.
  This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
  deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
  “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
  was an actual built target or a source Node.

executed_with_callbacks ()
  Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
  callback methods.
  This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
  deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
  “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
  was an actual built target or a source Node.

executed_without_callbacks ()
  Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
  Node’s callback methods.

fail_continue ()
  Explicit continue-the-build failure.
  This sets failure status on the target nodes and all of their dependent parent nodes.
  Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
  up-to-date nodes when using Configure().

fail_stop ()
  Explicit stop-the-build failure.
  This sets failure status on the target nodes and all of their dependent parent nodes.
  Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
  up-to-date nodes when using Configure().

failed ()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons
-c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t.
their dependencies) can use this as follows:

class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no
build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a
common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary
directories before the Action is actually called to build the targets.

trace_message(method, node, description='node')

exception SCons.Script.Main.SConsPrintHelpException
    Bases: Exception

args

with_traceback()
    Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.Script.Main.SetOption(name, value)

class SCons.Script.Main.Stats
    Bases: object

do_nothing(*args, **kw)

enable(outfp)

class SCons.Script.Main.TreePrinter (derived=False, prune=False, status=False, sLineDraw=False)
    Bases: object

display (!)

get_all_children (node)

get_derived_children (node)

SCons.Script.Main._SConstruct_exists (dirname='', repositories=[], filelist=None)
   This function checks that an SConstruct file exists in a directory. If so, it returns the path of the file. By default, it checks the current directory.

SCons.Script.Main._build_targets (fs, options, targets, target_top)

SCons.Script.Main._create_path (plist)

SCons.Script.Main._exec_main (parser, values)

SCons.Script.Main._load_all_site_scons_dirs (topdir, verbose=False)
   Load all of the predefined site_scons dirs. Order is significant; we load them in order from most generic (machine-wide) to most specific (topdir). The verbose argument is only for testing.

SCons.Script.Main._load_site_scons_dir (topdir, site_dir_name=None)
   Load the site directory under todir.
   If a site dir name is supplied use it, else use default “site_scons” Prepend site dir to sys.path. If a “site_tools” subdir exists, prepend to toolpath. Import “site_init.py” from site dir if it exists.

SCons.Script.Main._main (parser)

SCons.Script.Main._scons_internal_error ()
   Handle all errors but user errors. Print out a message telling the user what to do in this case and print a normal trace.

SCons.Script.Main._scons_internal_warning (e)
   Slightly different from _scons_user_warning in that we use the current call stack rather than sys.exc_info() to get our stack trace. This is used by the warnings framework to print warnings.

SCons.Script.Main._scons_syntax_error (e)
   Handle syntax errors. Print out a message and show where the error occurred.

SCons.Script.Main._scons_user_error (e)
   Handle user errors. Print out a message and a description of the error, along with the line number and routine where it occurred. The file and line number will be the deepest stack frame that is not part of SCons itself.

SCons.Script.Main._scons_user_warning (e)
   Handle user warnings. Print out a message and a description of the warning, along with the line number and routine where it occurred. The file and line number will be the deepest stack frame that is not part of SCons itself.

SCons.Script.Main._set_debug_values (options)

SCons.Script.Main._find_deepest_user_frame (tb)
   Find the deepest stack frame that is not part of SCons.
   Input is a “pre-processed” stack trace in the form returned by traceback.extract_tb() or traceback.extract_stack()

SCons.Script.Main._main ()

SCons.Script.Main._path_string (label, module)

SCons.Script.Main._version_string (label, module)

SCons.Script.SConsOptions module

108
SCons.Script.SConsOptions.Parser (version)
Returns an options parser object initialized with the standard SCons options.

class SCons.Script.SConsOptions.SConsIndentedHelpFormatter (indent_increment=2, max_help_position=24, width=None, short_first=1)
Bases: optparseIndentedHelpFormatter

NO_DEFAULT_VALUE = 'none'

_format_text (text)
Format a paragraph of free-form text for inclusion in the help output at the current indentation level.

dedent ()
expand_default (option)
format_description (description)
format_epilog (epilog)
format_heading (heading)
This translates any heading of “options” or “Options” into “SCons Options.” Unfortunately, we have to do this here, because those titles are hard-coded in the optparse calls.

format_option (option)
A copy of the normal optparse.IndentedHelpFormatter.format_option() method. This has been snarfed so we can modify text wrapping to out liking:

– add our own regular expression that doesn’t break on hyphens
  (so things like --no-print-directory don’t get broken);
– wrap the list of options themselves when it’s too long
  (the wrapper.fill(opts) call below);
– set the subsequent_indent when wrapping the help_text.

format_option_strings (option)
Return a comma-separated list of option strings & metavariables.

format_usage (usage)

indent ()
set_long_opt_delimiter (delim)
set_parser (parser)
set_short_opt_delimiter (delim)
store_option_strings (parser)

class SCons.Script.SConsOptions.SConsOption (*opts, **attrs)
Bases: optparse.Option

ACTIONS = ('store', 'store_const', 'store_true', 'store_false', 'append', 'append_const', 'count', 'callback', 'help', 'version')

ALWAYS_TYPED_ACTIONS = ('store', 'append')

ATTRS = ['action', 'type', 'dest', 'default', 'nargs', 'const', 'choices', 'callback', 'callback_args', 'callback_kwargs', 'help', 'metavar']
CHECK_METHODS = [<function Option._check_action>, <function Option._check_type>, <function Option._check_choice>, <function Option._check_dest>, <function Option._check_const>, <function Option._check_nargs>, <function Option._check_callback>, <function SConsOption._check_nargs_optional>]

CONST_ACTIONS = ('store_const', 'append_const', 'store', 'append', 'callback')
STORE_ACTIONS = ('store', 'store_const', 'store_true', 'store_false', 'append', 'append_const', 'count')
TYPED_ACTIONS = ('store', 'append', 'callback')
TYPES = ('string', 'int', 'long', 'float', 'complex', 'choice')
TYPE_CHECKER = {'choice': <function check_choice>, 'complex': <function check_builtin>, 'float': <function check_builtin>, 'int': <function check_builtin>, 'long': <function check_builtin>}

_check_action ()
_check_callback ()
_check_choice ()
_check_const ()
_check_dest ()
_check_nargs ()
_check_nargs_optional ()
_check_opt_strings (opts)
_check_type ()
_set_attrs (attrs)
_set_opt_strings (opts)
check_value (opt, value)
convert_value (opt, value)

process (opt, value, values, parser)
take_action (action, dest, opt, value, values, parser)
takes_value ()

class SCons.Script.SConsOptions.SConsOptionGroup (parser, title, description=None)
Bases: optparse.OptionGroup
A subclass for SCons-specific option groups.
The only difference between this and the base class is that we print the group’s help text flush left, underneath their own title but lined up with the normal “SCons Options”.

_check_conflict (option)
_create_option_list ()
_create_option_mappings ()
add_option (Option)
    add_option(opt_str, ..., kwarg=val, ...)

add_options (option_list)

destroy ()
    see OptionParser.destroy().

format_description (formatter)

format_help (formatter)
    Format an option group's help text, outdenting the title so it's flush with the "SCons Options" title we print at the top.

format_option_help (formatter)

get_description ()

get_option (opt_str)

has_option (opt_str)

remove_option (opt_str)

set_conflict_handler (handler)

set_description (description)

set_title (title)

class SCons.Script.SConsOptions.SConsOptionParser (usage=None, option_list=None, option_class=<class 'optparse.Option'>, version=None, conflict_handler='error', description=None, formatter=None, add_help_option=True, prog=None, epilog=None)
    Bases: optparse.OptionParser

    _add_help_option ()

    _add_version_option ()

    _check_conflict (option)

    _create_option_list ()

    _create_option_mappings ()

    _get_all_options ()

    _get_args (args)

    _init_parsing_state ()

    _match_long_opt (opt: string) → string
        Determine which long option string 'opt' matches, ie. which one it is an unambiguous abbreviation for. Raises BadOptionError if 'opt' doesn't unambiguously match any long option string.

    _populate_option_list (option_list, add_help=True)

    _process_args (largs, rargs, values)
_process_args(largs : [string],
    rargs : [string], values : Values)
Process command-line arguments and populate 'values', consuming options and arguments from 'rargs'. If 'allow_interspersed_args' is false, stop at the first non-option argument. If true, accumulate any interspersed non-option arguments in 'largs'.

_process_long_opt (rargs, values)
SCons-specific processing of long options.
This is copied directly from the normal optparse._process_long_opt() method, except that, if configured to do so, we catch the exception thrown when an unknown option is encountered and just stick it back on the “leftover” arguments for later (re-)processing.

_process_short_opt (rargs, values)

_share_option_mappings (parser)

add_local_option(*args, **kw)
Add a local option to the parser.
This is initiated by an AddOption() call to add a user-defined command-line option. We add the option to a separate option group for the local options, creating the group if necessary.

add_option (Option)
add_option(opt_str, ..., kwarg=val, ...)

add_option_group(*args, **kwargs)

add_options (option_list)

check_values (values: Values, args: [string])
- (values : Values, args : [string])
Check that the supplied option values and leftover arguments are valid. Returns the option values and leftover arguments (possibly adjusted, possibly completely new – whatever you like). Default implementation just returns the passed-in values; subclasses may override as desired.

destroy()
Declare that you are done with this OptionParser. This cleans up reference cycles so the OptionParser (and all objects referenced by it) can be garbage-collected promptly. After calling destroy(), the OptionParser is unusable.

disable_interspersed_args()
Set parsing to stop on the first non-option. Use this if you have a command processor which runs another command that has options of its own and you want to make sure these options don’t get confused.

enable_interspersed_args()
Set parsing to not stop on the first non-option, allowing interspersing switches with command arguments. This is the default behavior. See also disable_interspersed_args() and the class documentation description of the attribute allow_interspersed_args.

error (msg: string)
Print a usage message incorporating ‘msg’ to stderr and exit. If you override this in a subclass, it should not return – it should either exit or raise an exception.

exit (status=0, msg=None)

expand_prog_name (s)

format_description (formatter)

format_epilog (formatter)
format_help (formatter=None)

format_option_help (formatter=None)

get_default_values ()

get_description ()

get_option (opt_str)

get_option_group (opt_str)

get_prog_name ()

get_usage ()

get_version ()

has_option (opt_str)

parse_args (args=None, values=None)

    parse_args(args : [string] = sys.argv[1:],
               values : Values = None)

    -> (values : Values, args : [string])

    Parse the command-line options found in ‘args’ (default: sys.argv[1:]) Any errors result in a call to 'error()', which by default prints the usage message to stderr and calls sys.exit() with an error message. On success returns a pair (values, args) where ‘values’ is a Values instance (with all your option values) and ‘args’ is the list of arguments left over after parsing options.

preserve_unknown_options = False

print_help (file: file = stdout)

    Print an extended help message, listing all options and any help text provided with them, to ‘file’ (default stdout).

print_usage (file: file = stdout)

    Print the usage message for the current program (self.usage) to ‘file’ (default stdout). Any occurrence of the string "%prog" in self.usage is replaced with the name of the current program (basename of sys.argv[0]). Does nothing if self.usage is empty or not defined.

print_version (file: file = stdout)

    Print the version message for this program (self.version) to ‘file’ (default stdout). As with print_usage(), any occurrence of “%prog” in self.version is replaced by the current program’s name. Does nothing if self.version is empty or undefined.

remove_option (opt_str)

reparse_local_options ()

    Re-parse the leftover command-line options. Parse options stored in self.largs, so that any value overridden on the command line is immediately available if the user turns around and does a GetOption() right away.

    We mimic the processing of the single args in the original OptionParser .process_args(), but here we allow exact matches for long-opts only (no partial argument names!). Otherwise there could be problems in add_local_option() below. When called from there, we try to reparse the command-line arguments that

    1. haven’t been processed so far (self.largs), but

    2. are possibly not added to the list of options yet.

    So, when we only have a value for “--myargument” so far, a command-line argument of “--myarg=test” would set it, per the behaviour of .match_long_opt(), which allows for partial matches of the option name, as long as the common prefix appears to be unique. This would lead to further confusion, because we might want to add another option “--myarg” later on (see issue #2929).
set_conflict_handler (handler)

set_default (dest, value)

set_defaults (**kwargs)

set_description (description)

set_process_default_values (process)

set_usage (usage)

standard_option_list = []

class SCons.Script.SConsOptions.SConsValues (defaults)
Bases: optparse.Values

Holder class for uniform access to SCons options, regardless of whether or not they can be set on the command line or in the SConscript files (using the SetOption() function).

A SCons option value can originate three different ways:

1. set on the command line;
2. set in an SConscript file;
3. the default setting (from the the op.add_option() calls in the Parser() function, below).

The command line always overrides a value set in a SConscript file, which in turn always overrides default settings. Because we want to support user-specified options in the SConscript file itself, though, we may not know about all of the options when the command line is first parsed, so we can’t make all the necessary precedence decisions at the time the option is configured.

The solution implemented in this class is to keep these different sets of settings separate (command line, SConscript file, and default) and to override the __getattr__() method to check them in turn. This should allow the rest of the code to just fetch values as attributes of an instance of this class, without having to worry about where they came from.

Note that not all command line options are settable from SConscript files, and the ones that are must be explicitly added to the “settable” list in this class, and optionally validated and coerced in the set_option() method.

_update (dict, mode)

_update_careful (dict)
Update the option values from an arbitrary dictionary, but only use keys from dict that already have a corresponding attribute in self. Any keys in dict without a corresponding attribute are silently ignored.

_update_loose (dict)
Update the option values from an arbitrary dictionary, using all keys from the dictionary regardless of whether they have a corresponding attribute in self or not.

ensure_value (attr, value)

read_file (filename, mode='careful')

read_module (modname, mode='careful')

set_option (name, value)
Sets an option from an SConscript file.

Raises: UserError – invalid or malformed option (“error in your script”)

settable = ['clean', 'diskcheck', 'duplicate', 'experimental', 'hash_chunksize', 'hash_format', 'help', 'implicit_cache', 'implicit_deps_changed', 'implicit_deps_unchanged', 'max_drift', 'md5_chunksize', 'no_exec', 'no_progress', 'num_jobs', 'random', 'silent', 'stack_size', 'warn', 'disable_execute_ninja', 'disable_ninja']

SCons.Script.SConsOptions.diskcheck_convert (value)
This module defines the Python API provided to SConscript files.

\[\]`SCons.Script.SConscript.BuildDefaultGlobals()`
Create a dictionary containing all the default globals for SConstruct and SConscript files.

\[\]`SCons.Script.SConscript.Configure(*args, **kw)`

class `SCons.Script.SConscript.DefaultEnvironmentCall(method_name, subst=0)`
A class that implements “global function” calls of Environment methods by fetching the specified method from the DefaultEnvironment’s class. Note that this uses an intermediate proxy class instead of calling the DefaultEnvironment method directly so that the proxy can override the subst() method and thereby prevent expansion of construction variables (since from the user’s point of view this was called as a global function, with no associated construction environment).

class `SCons.Script.SConscript.Frame(fs, exports, sconscript)`
A frame on the SConstruct/SConscript call stack

class `SCons.Script.SConscript.Return(*vars, **kw)`

class `SCons.Script.SConscript.SConsEnvironment(platform=None, tools=None, toolpath=None, variables=None, parse_flags=None, **kw)`
An Environment subclass that contains all of the methods that are particular to the wrapper SCons interface and which aren’t (or shouldn’t be) part of the build engine itself.

Note that not all of the methods of this class have corresponding global functions, there are some private methods.

Action(*args, **kw)

AddMethod(function, name=None)
Adds the specified function as a method of this construction environment with the specified name. If the name is omitted, the default name is the name of the function itself.

AddPostAction(files, action)

AddPreAction(files, action)

Alias(target, source=[], action=None, **kw)

AlwaysBuild(*targets)

Append(**kw)
Append values to construction variables in an Environment. The variable is created if it is not already present.

AppendENVPath(name, newpath, envname='ENV', sep=':', delete_existing=0)
Append path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any particular path once, and will normpath and normcase all paths to help assure this. This can also handle the case where the env variable is a list instead of a string.
If delete_existing is 0, a newpath which is already in the path will not be moved to the end (it will be left where it is).

AppendUnique(delete_existing=0, **kw)
Append values to existing construction variables in an Environment, if they’re not already there. If delete_existing is 1, removes existing values first, so values move to end.

Builder(**kw)

CacheDir(path, custom_class=None)
Clean (targets, files)

Clone (tools=[], toolpath=None, parse_flags=None, **kw)
Return a copy of a construction Environment.
The copy is like a Python “deep copy”–that is, independent copies are made recursively of each objects–except
that a reference is copied when an object is not deep-copyable (like a function). There are no references to any
mutable objects in the original Environment.

Command (target, source, action, **kw)
Builds the supplied target files from the supplied source files using the supplied action. Action may be any type
that the Builder constructor will accept for an action.

Configure (*args, **kw)

Decider (function)

Default (*targets)

Depends (target, dependency)
Explicitly specify that ‘target’s depend on ‘dependency’.

Detect (progs)
Return the first available program from one or more possibilities.

Parameters:  progs (str or list) – one or more command names to check for

Dictionary (*args)
Return construction variables from an environment.

Parameters:  *args (optional) – variable names to look up
Returns:  If args omitted, the dictionary of all construction variables. If one arg, the corresponding
         value is returned. If more than one arg, a list of values is returned.
Raises:  KeyError – if any of args is not in the construction environment.

Dir (name, *args, **kw)

Dump (key=None, format='pretty')
Return construction variables serialized to a string.

Parameters:
  • key (optional) – if None, format the whole dict of variables. Else format the value of
    key (Default value = None)
  • format (str, optional) – specify the format to serialize to. “pretty” generates a
    pretty-printed string, “json” a JSON-formatted string. (Default value = “pretty”)

EnsurePythonVersion (major, minor)
Exit abnormally if the Python version is not late enough.

EnsureSConsVersion (major, minor, revision=0)
Exit abnormally if the SCons version is not late enough.

Entry (name, *args, **kw)

Environment (**kw)

Execute (action, *args, **kw)
Directly execute an action through an Environment

Exit (value=0)

Export (*vars, **kw)
File (name, *args, **kw)

FindFile (file, dirs)

FindInstalledFiles ()
returns the list of all targets of the Install and InstallAs Builder.

FindIxes (paths, prefix, suffix)
Search a list of paths for something that matches the prefix and suffix.

Parameters:
- paths – the list of paths or nodes.
- prefix – construction variable for the prefix.
- suffix – construction variable for the suffix.

Returns: the matched path or None

FindSourceFiles (node=’.’)
returns a list of all source files.

Flatten (sequence)

GetBuildPath (files)

GetLaunchDir ()

GetOption (name)

Glob (pattern, ondisk=True, source=False, strings=False, exclude=None)

Help (text, append=False)

Ignore (target, dependency)
Ignore a dependency.

Import (*vars)

Literal (string)

Local (*targets)

MergeFlags (args, unique=True)
Merge flags into construction variables.
Merges the flags from args into this construction environment. If args is not a dict, it is first converted to a
dictionary with flags distributed into appropriate construction variables. See ParseFlags ()

Parameters:
- args – flags to merge
- unique – merge flags rather than appending (default: True)

NoCache (*targets)
Tags a target so that it will not be cached

NoClean (*targets)
Tags a target so that it will not be cleaned by -c

Override (overrides)
Produce a modified environment whose variables are overridden by the overrides dictionaries. “overrides” is a
dictionary that will override the variables of this environment.
This function is much more efficient than Clone () or creating a new Environment because it doesn’t copy the
construction environment dictionary, it just wraps the underlying construction environment, and doesn’t even
create a wrapper object if there are no overrides.
**ParseConfig** (command, function=None, unique=True)

Use the specified function to parse the output of the command in order to modify the current environment. The ‘command’ can be a string or a list of strings representing a command and its arguments. ‘Function’ is an optional argument that takes the environment, the output of the command, and the unique flag. If no function is specified, MergeFlags, which treats the output as the result of a typical ‘X-config’ command (i.e. gtk-config), will merge the output into the appropriate variables.

**ParseDepends** (filename, must_exist=None, only_one=False)

Parse a mkdep-style file for explicit dependencies. This is completely abusable, and should be unnecessary in the “normal” case of proper SCons configuration, but it may help make the transition from a Make hierarchy easier for some people to swallow. It can also be genuinely useful when using a tool that can write a .d file, but for which writing a scanner would be too complicated.

**ParseFlags** (*flags)

Return a dict of parsed flags. Parse flags and return a dict with the flags distributed into the appropriate construction variable names. The flags are treated as a typical set of command-line flags for a GNU-like toolchain, such as might have been generated by one of the (foo)-config scripts, and used to populate the entries based on knowledge embedded in this method - the choices are not expected to be portable to other toolchains.

If one of the flags strings begins with a bang (exclamation mark), it is assumed to be a command and the rest of the string is executed; the result of that evaluation is then added to the dict.

**Platform** (platform)

**Precious** (*targets)

**Prepend** (**kw)

Prepend values to construction variables in an Environment. The variable is created if it is not already present.

**PrependENVPath** (name, newpath, envname='ENV', sep=':', delete_existing=1)

Prepend path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any particular path once, and will normpath and normcase all paths to help assure this. This can also handle the case where the env variable is a list instead of a string.

If delete_existing is 0, a newpath which is already in the path will not be moved to the front (it will be left where it is).

**PrependUnique** (delete_existing=0, **kw)

Prepend values to existing construction variables in an Environment, if they’re not already there. If delete_existing is 1, removes existing values first, so values move to front.

**Pseudo** (*targets)

**PyPackageDir** (modulename)

**RemoveMethod** (function)

Removes the specified function’s MethodWrapper from the added_methods list, so we don’t re-bind it when making a clone.

**Replace** (**kw)

Replace existing construction variables in an Environment with new construction variables and/or values.

**ReplaceIxes** (path, old_prefix, old_suffix, new_prefix, new_suffix)

Replace old_prefix with new_prefix and old_suffix with new_suffix.

env - Environment used to interpolate variables. path - the path that will be modified. old_prefix - construction variable for the old prefix. old_suffix - construction variable for the old suffix. new_prefix - construction variable for the new prefix. new_suffix - construction variable for the new suffix.

**Repository** (*dirs, **kw)

**Requires** (target, prerequisite)
Specify that ‘prerequisite’ must be built before ‘target’, (but ‘target’ does not actually depend on ‘prerequisite’ and need not be rebuilt if it changes).

**SConscript (\*ls, **kw)**
Execute SCons configuration files.

**Parameters:**

- \*ls *(str or list)* – configuration file(s) to execute.

**Keyword Arguments:**

- dirs *(list)* – execute SConscript in each listed directory.
- name *(str)* – execute script ‘name’ (used only with ‘dirs’).
- exports *(list or dict)* – locally export variables the called script(s) can import.
- variant_dir *(str)* – mirror sources needed for the build in a variant directory to allow building in it.
- duplicate *(bool)* – physically duplicate sources instead of just adjusting paths of derived files (used only with ‘variant_dir’) (default is True).
- must_exist *(bool)* – fail if a requested script is missing (default is False, default is deprecated).

**Returns:**

- list of variables returned by the called script

**Raises:**

- UserError – a script is not found and such exceptions are enabled.

**SConscriptChdir (flag)**

**SConsignFile (name=’.sconsign’, dbm_module=None)**

**Scanner (*args, **kw)**

**SetDefault (**kw)**

**SetOption (name, value)**

**SideEffect (side_effect, target)**
Tell scons that side_effects are built as side effects of building targets.

**Split (arg)**
This function converts a string or list into a list of strings or Nodes. This makes things easier for users by allowing files to be specified as a white-space separated list to be split.

**The input rules are:**

- A single string containing names separated by spaces. These will be split apart at the spaces.
- A single Node instance
- A list containing either strings or Node instances. Any strings in the list are not split at spaces.
  In all cases, the function returns a list of Nodes and strings.

**Tool (tool, toolpath=None, **kwargs) → SCons.Tool.Tool**

**Value (value, built_value=None, name=None)**

**VariantDir (variant_dir, src_dir, duplicate=1)**

**WhereIs (prog, path=None, pathext=None, reject=None)**
Find prog in the path.

**_canonicalize (path)**
Allow Dirs and strings beginning with # for top-relative.
Note this uses the current env’s fs (in self).

**_changed_build (dependency, target, prev_ni, repo_node=None)**
_changed_content (dependency, target, prev_ni, repo_node=None)

_changed_source (dependency, target, prev_ni, repo_node=None)

_changed_timestamp_match (dependency, target, prev_ni, repo_node=None)

_changed_timestamp_newer (dependency, target, prev_ni, repo_node=None)

_changed_timestamp_then_content (dependency, target, prev_ni, repo_node=None)

_exceeds_version (major, minor, v_major, v_minor)
    Return 1 if 'major' and 'minor' are greater than the version in 'v_major' and 'v_minor', and 0 otherwise.

_find_toolpath_dir (tp)

_get_SConscript_filenames (ls, kw)
    Convert the parameters passed to SConscript() calls into a list of files and export variables. If the parameters are invalid, throws SCons.Errors.UserError. Returns a tuple (l, e) where l is a list of SConscript filenames and e is a list of exports.

_get_major_minor_revision (version_string)
    Split a version string into major, minor and (optionally) revision parts.
    This is complicated by the fact that a version string can be something like 3.2b1.

_gsm ()

_init_special ()
    Initial the dispatch tables for special handling of special construction variables.

_update (other)
    Private method to update an environment’s consvar dict directly.
    Bypasses the normal checks that occur when users try to set items.

_update_onlynew (other)
    Private method to add new items to an environment’s consvar dict.
    Only adds items from other whose keys do not already appear in the existing dict; values from other are not used for replacement. Bypasses the normal checks that occur when users try to set items.

arg2nodes (args, node_factory=<class 'SCons.Environment._Null'>, lookup_list=<class 'SCons.Environment._Null'>,**kw)

backtick (command)

get (key, default=None)
    Emulates the get() method of dictionaries.

get_CacheDir ()

get_builder (name)
    Fetch the builder with the specified name from the environment.

get_factory (factory, default='File')
    Return a factory function for creating Nodes for this construction environment.

get_scanner (skey)
    Find the appropriate scanner given a key (usually a file suffix).

get_src_sig_type ()

get_tgt_sig_type ()
gvars ()

items ()
   Emulates the items() method of dictionaries.

keys ()
   Emulates the keys() method of dictionaries.

lvars ()

scanner_map_delete (kw=None)
   Delete the cached scanner map (if we need to).

setdefault (key, default=None)
   Emulates the setdefault() method of dictionaries.

subst (string, raw=0, target=None, source=None, conv=None, executor=None)
   Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

subst_kw (kw, raw=0, target=None, source=None)

subst_list (string, raw=0, target=None, source=None, conv=None, executor=None)
   Calls through to SCons.Subst.scons_subst_list(). See the documentation for that function.

subst_path (path, target=None, source=None)
   Substitute a path list, turning EntryProxies into Nodes and leaving Nodes (and other objects) as-is.

subst_target_source (string, raw=0, target=None, source=None, conv=None, executor=None)
   Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

validate_CacheDir_class (custom_class=None)
   Validate the passed custom CacheDir class, or if no args are passed, validate the custom CacheDir class from the environment.

values ()
   Emulates the values() method of dictionaries.

exception SCons.Script.SConscript.SConscriptReturn
   Bases: Exception

args

with_traceback ()
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.Script.SConscript.SConscript_exception (file=<_io.TextIOWrapper name='<stderr>' mode='w' encoding='utf-8'>)
   Print an exception stack trace just for the SConscript file(s). This will show users who have Python errors where the problem is, without cluttering the output with all of the internal calls leading up to where we exec the SConscript.

SCons.Script.SConscript._SConscript (fs, *files, **kw)

SCons.Script.SConscript.annotate (node)
   Annotate a node with the stack frame describing the SConscript file and line number that created it.

SCons.Script.SConscript.compute_exports (exports)
Compute a dictionary of exports given one of the parameters to the Export() function or the exports argument to SConscript().

SCons.Script.SConscript.get_DefaultEnvironmentProxy()

SCons.Script.SConscript.get_calling_namespaces()

Return the locals and globals for the function that called into this module in the current call stack.

SCons.Script.SConscript.handle_missing_SConscript(f, must_exist=None)

Take appropriate action on missing file in SConscript() call. Print a warning or raise an exception on missing file, unless missing is explicitly allowed by the must_exist value. On first warning, print a deprecation message.

Parameters:

- f (str) – path of missing configuration file
- must_exist (bool) – if true, fail. If false, but not None, allow the file to be missing. The default is None, which means issue the warning. The default is deprecated.

Raises: UserError – if must_exist is true or if global SCons.Script._no_missing_sconscript is true.

### Module contents

The main() function used by the scons script.

Architecturally, this is the scons script, and will likely only be called from the external “scons” wrapper. Consequently, anything here should not be, or be considered, part of the build engine. If it’s something that we expect other software to want to use, it should go in some other module. If it’s specific to the “scons” script invocation, it goes here.

SCons.Script.HelpFunction(text, append=False)

class SCons.Script.TargetList (initlist=None)

Bases: collections.UserList

_add_Default ([list])

_clear ()

_do_nothing (*args, **kw)

append (item)

S.append(value) – append value to the end of the sequence

clear () – None – remove all items from S

copy ()

count (value) – integer – return number of occurrences of value

extend (other)

S.extend(iterable) – extend sequence by appending elements from the iterable

index (value[, start[, stop]]) – integer – return first index of value.

Raises ValueError if the value is not present.

Supporting start and stop arguments is optional, but recommended.

insert (i, item)

S.insert(index, value) – insert value before index

pop ([, index]) – item – remove and return item at index (default last).

Raise IndexError if list is empty or index is out of range.
remove (item)
  S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse()
  S.reverse() – reverse IN PLACE

sort (*args, **kwds)
SCons.Script.Variables (files=None, args={})
SCons.Script._Add_Arguments (alist)
SCons.Script._Add_Targets (tlist)
SCons.Script._Get_Default_Targets (d, fs)
SCons.Script._Set_Default_Targets (env, tlist)
SCons.Script._Set_Default_Targets_Has_Been_Called (d, fs)
SCons.Script._Set_Default_Targets_Has_Not_Been_Called (d, fs)
SCons.Script.set_missing_sconscript_error (flag=1)
  Set behavior on missing file in SConscript() call.
  Returns: previous value

SCons.Tool package

Module contents
SCons.Tool
  SCons tool selection.
  This looks for modules that define a callable object that can modify a construction environment as appropriate for a
given tool (or tool chain).
  Note that because this subsystem just selects a callable that can modify a construction environment, it’s possible for people to define their own “tool specification” in an arbitrary callable function. No one needs to use or tie in to this subsystem in order to roll their own tool specifications.
SCons.Tool.CreateJarBuilder (env)
  The Jar builder expects a list of class files which it can package into a jar file.
  The jar tool provides an interface for passing other types of java files such as .java, directories or swig interfaces
  and will build them to class files in which it can package into the jar.
SCons.Tool.CreateJavaClassDirBuilder (env)
SCons.Tool.CreateJavaClassFileBuilder (env)
SCons.Tool.CreateJavaFileBuilder (env)
SCons.Tool.CreateJavaHBuilder (env)
SCons.Tool.FindAllTools (tools, env)
SCons.Tool.FindTool (tools, env)
SCons.Tool.Initializers (env)

class SCons.Tool.Tool (name, toolpath=None, **kwargs)
  Bases: object

  _load_dotted_module_py2 (short_name, full_name, searchpaths=None)

  _tool_module ()

class SCons.Tool.ToolInitializer (env, tools, names)
  Bases: object
A class for delayed initialization of Tools modules.
Instances of this class associate a list of Tool modules with a list of Builder method names that will be added by
those Tool modules. As part of instantiating this object for a particular construction environment, we also add the
appropriate ToolInitializerMethod objects for the various Builder methods that we want to use to delay Tool
searches until necessary.

apply_tools(env)
  Searches the list of associated Tool modules for one that exists, and applies that to the construction
  environment.

remove_methods(env)
  Removes the methods that were added by the tool initialization so we no longer copy and re-bind them when the
  construction environment gets cloned.

class SCons.Tool.ToolInitializerMethod (name, initializer)
  Bases: object
  This is added to a construction environment in place of a method(s) normally called for a Builder (env.Object,
  env.StaticObject, etc.). When called, it has its associated ToolInitializer object search the specified list of tools and
  apply the first one that exists to the construction environment. It then calls whatever builder was (presumably)
  added to the construction environment in place of this particular instance.

get_builder(env)
  Returns the appropriate real Builder for this method name after having the associated ToolInitializer object apply
  the appropriate Tool module.

SCons.Tool.createCFileBuilders (env)
  This is a utility function that creates the CFile/CXXFile Builders in an Environment if they are not there already.
  If they are there already, we return the existing ones.
  This is a separate function because soooo many Tools use this functionality.
  The return is a 2-tuple of (CFile, CXXFile)

SCons.Tool.createLoadableModuleBuilder (env, loadable_module_suffix='$_LDMODULESUFFIX')
  This is a utility function that creates the LoadableModule Builder in an Environment if it is not there already.
  If it is already there, we return the existing one.

Parameters:  loadable_module_suffix – The suffix specified for the loadable module builder

SCons.Tool.createObjBuilders (env)
  This is a utility function that creates the StaticObject and SharedObject Builders in an Environment if they are not
  there already.
  If they are there already, we return the existing ones.
  This is a separate function because sooo many Tools use this functionality.
  The return is a 2-tuple of (StaticObject, SharedObject)

SCons.Tool.createProgBuilder (env)
  This is a utility function that creates the Program Builder in an Environment if it is not there already.
  If it is already there, we return the existing one.

SCons.Tool.createSharedLibBuilder (env, shlib_suffix='$_SHLIBSUFFIX')
  This is a utility function that creates the SharedLibrary Builder in an Environment if it is not there already.
  If it is already there, we return the existing one.

Parameters:  shlib_suffix – The suffix specified for the shared library builder

SCons.Tool.createStaticLibBuilder (env)
  This is a utility function that creates the StaticLibrary Builder in an Environment if it is not there already.
  If it is already there, we return the existing one.

SCons.Tool.find_program_path (env, key_program, default_paths=None)
  Find the location of a tool using various means.
  Mainly for windows where tools aren’t all installed in /usr/bin, etc.
Parameters:

- `env` – Current Construction Environment.
- `key_program` – Tool to locate.
- `default_paths` – List of additional paths this tool might be found in.

SCons.Tool.tool_list (platform, env)

SCons.Variables package

Submodules

SCons.Variables.BoolVariable module

Option type for true/false Variables.

Usage example:

```python
opts = Variables()
opts.Add(BoolVariable('embedded', 'build for an embedded system', 0))
...
if env['embedded'] == 1:
  ...
```

The input parameters describe a boolean option, thus they are returned with the correct converter and validator appended. The 'help' text will be appended by '(yes|no) to show the valid valued. The result is usable for input to opts.Add()..

SCons.Variables.BoolVariable._text2bool (val)

Converts strings to True/False depending on the 'truth' expressed by the string. If the string can't be converted, the original value will be returned.

See '__true_strings' and '__false_strings' for values considered 'true' or 'false respectively.

This is usable as 'converter' for SCons' Variables.

SCons.Variables.BoolVariable._validator (key, val, env)

Validates the given value to be either '0' or '1'.

This is usable as 'validator' for SCons' Variables.

SCons.Variables.EnumVariable module

Option type for enumeration Variables.

This file defines the option type for SCons allowing only specified input-values.

Usage example:

```python
opts = Variables()
opts.Add(  
    EnumVariable(  
        'debug',  
        'debug output and symbols',  
        'no',  
        allowed_values=('yes', 'no', 'full'),  
        map={},  
        ignorecase=2,  
    )  
)
...
if env['debug'] == 'full':
  ...
```

SCons.Variables.EnumVariable.EnumVariable (key, help, default, allowed_values, map={}, ignorecase=0)
The input parameters describe an option with only certain values allowed. They are returned with an appropriate
converter and validator appended. The result is usable for input to Variables.Add().
‘key’ and ‘default’ are the values to be passed on to Variables.Add().
‘help’ will be appended by the allowed values automatically
‘allowed_values’ is a list of strings, which are allowed as values for this option.
The ‘map’-dictionary may be used for converting the input value into canonical values (e.g. for aliases).
‘ignorecase’ defines the behaviour of the validator:
If ignorecase == 0, the validator/converter are case-sensitive. If ignorecase == 1, the validator/converter are
case-insensitive. If ignorecase == 2, the validator/converter is case-insensitive and the converted value will
always be lower-case.
The ‘validator’ tests whether the value is in the list of allowed values. The ‘converter’ converts input values
according to the given ‘map’-dictionary (unmapped input values are returned unchanged).

**SCons.Variables.ListVariable module**

Option type for list Variables.
This file defines the option type for SCons implementing ‘lists’.
A ‘list’ option may either be ‘all’, ‘none’ or a list of names separated by comma. After the option has been processed,
the option value holds either the named list elements, all list elements or no list elements at all.

Usage example:

```python
list_of_libs = Split('x11 gl qt ical')

opts = Variables()
opts.Add(
    ListVariable(
        'shared',
        'libraries to build as shared libraries',
        'all',
        elems=list_of_libs,
    )
)

for lib in list_of_libs:
    if lib in env['shared']:
        env.SharedObject(...)
    else:
        env.Object(...)
```

**SCons.Variables.ListVariable.ListVariable** (key, help, default, names, map={})
The input parameters describe a ‘package list’ option, thus they are returned with the correct converter and
validator appended. The result is usable for input to opts.Add().
A ‘package list’ option may either be ‘all’, ‘none’ or a list of package names (separated by space).

**SCons.Variables.PackageVariable module**

Option type for package Variables.
This file defines the option type for SCons implementing ‘package activation’.
To be used whenever a ‘package’ may be enabled/disabled and the package path may be specified.

Usage example:

Examples:

x11=no (disables X11 support) x11=yes (will search for the package installation dir) x11=/usr/local/X11 (will
check this path for existence)

To replace autoconf’s –with-xxx=yyy
```python
opts = Variables()
opts.Add(PackageVariable('x11',
    'use X11 installed here (yes = search some places',
    'yes'))
...
if env['x11'] == True:
    dir = ... search X11 in some standard places ...
    env['x11'] = dir
if env['x11']:
    ... build with x11 ...
```

**SCons.Variables.PackageVariable**

`PackageVariable(key, help, default, searchfunc=None)`

The input parameters describe a ‘package list’ option, thus they are returned with the correct converter and validator appended. The result is usable for input to `opts.Add()`.

A ‘package list’ option may either be ‘all’, ‘none’ or a list of package names (separated by space).

```python
SCons.Variables.PackageVariable._converter(val)
SCons.Variables.PackageVariable._validator(key, val, env, searchfunc)
```

**SCons.Variables.PathVariable module**

Option type for path Variables.

This file defines an option type for SCons implementing path settings.

To be used whenever a user-specified path override should be allowed.

**Arguments to PathVariable are:**

- `option-name` = name of this option on the command line (e.g. “prefix”)  
- `option-help` = help string for option  
- `option-dflt` = default value for this option validator  
- `option_validator` = [optional] validator for option value. Predefined are:
  - `PathAccept` – accepts any path setting; no validation  
  - `PathIsDir` – path must be an existing directory  
  - `PathIsDirCreate` – path must be a dir; will create  
  - `PathIsFile` – path must be a file  
  - `PathExists` – path must exist (any type) [default]

The validator is a function that is called and which should return True or False to indicate if the path is valid. The arguments to the validator function are: (key, val, env). The key is the name of the option, the val is the path specified for the option, and the env is the env to which the Options have been added.

**Usage example:**

```python
Examples:
    prefix=/usr/local

opts = Variables()
```

```python
opts = Variables()
opts.Add(PathVariable('qtdir',
    'where the root of Qt is installed',
    qtdir, PathIsDir))
```  
```python
opts.Add(PathVariable('qt_includes',
    'where the Qt includes are installed',
    '$qtdir/includes', PathIsDirCreate))
```  
```python
opts.Add(PathVariable('qt_libraries',
    'where the Qt library is installed',
    '$qtdir/lib'))
```  

**Module contents**

Add user-friendly customizable variables to an SCons build.

```python
class SCons.Variables.Variables (files=None, args=None, is_global=True)
    Bases: object
    Holds all the options, updates the environment with the variables, and renders the help text.
```

127
If is_global is True, this is a singleton, create only once.

Parameters:

- **files** *(optional)* – List of option configuration files to load (backward compatibility). If a single string is passed it is automatically placed in a file list (Default value = None)
- **args** *(optional)* – dictionary to override values set from files. (Default value = None)
- **is_global** *(optional)* – global instance? (Default value = True)

**Add**(key, help='', default=None, validator=None, converter=None, **kw)

Add an option.

Parameters:

- **key** – the name of the variable, or a list or tuple of arguments
- **help** – optional help text for the options (Default value = '')
- **default** – optional default value for option (Default value = None)
- **validator** – optional function called to validate the option’s value (Default value = None)
- **converter** – optional function to be called to convert the option’s value before putting it in the environment. (Default value = None)
- ****kw – keyword args, unused.

**AddVariables** (*optlist*)

Add a list of options.

Each list element is a tuple/list of arguments to be passed on to the underlying method for adding options.

Example:

```python
opt.AddVariables(  
    ('debug', '', 0),  
    ('CC', 'The C compiler'),  
    ('VALIDATE', 'An option for testing validation', 'notset', validator, None),  
)
```

**FormatVariableHelpText** (env, key, help, default, actual, aliases=[])

**GenerateHelpText** (env, sort=None)

Generate the help text for the options.

**Save**(filename, env)

Saves all the options in the given file. This file can then be used to load the options next run. This can be used to create an option cache file.

filename - Name of the file to save into env - the environment get the option values from

**UnknownVariables** ()

Returns any options in the specified arguments lists that were not known, declared options in this object.

**Update**(env, args=None)

Update an environment with the option variables.

env - the environment to update.

**_do_add**(key, help='', default=None, validator=None, converter=None)

format = \'\n%s: %s\n default: %s\n actual: %s\n\'
SCons Project API Documentation

format_ = "in%s: %s in default: %s in actual: %s in aliases: %s"

instance = None

keys()  Returns the keywords for the options

---

**SCons.compat package**

**Module contents**

SCons compatibility package for old Python versions

This subpackage holds modules that provide backwards-compatible implementations of various things from newer Python versions that we cannot count on because SCons still supported older Pythons.

Other code will not generally reference things in this package through the SCons.compat namespace. The modules included here add things to the builtins namespace or the global module list so that the rest of our code can use the objects and names imported here regardless of Python version. As a result, if this module is used, it should violate the normal convention for imports (standard library imports first, then program-specific imports, each ordered alphabetically) and needs to be listed first.

The rest of the things here will be in individual compatibility modules that are either: 1) suitably modified copies of the future modules that we want to use; or 2) backwards compatible re-implementations of the specific portions of a future module’s API that we want to use.

GENERAL WARNINGS: Implementations of functions in the SCons.compat modules are **NOT** guaranteed to be fully compliant with these functions in later versions of Python. We are only concerned with adding functionality that we actually use in SCons, so be wary if you lift this code for other uses. (That said, making these more nearly the same as later, official versions is still a desirable goal, we just don’t need to be obsessive about it.)

We name the compatibility modules with an initial `_scons_` (for example, _scons_subprocess.py is our compatibility module for subprocess) so that we can still try to import the real module name and fall back to our compatibility module if we get an ImportError. The import_as() function defined below loads the module as the “real” name (without the `_scons`), after which all of the “import {module}” statements in the rest of our code will find our pre-loaded compatibility module.

```python
class SCons.compat.NoSlotsPyPy (name, bases, dct):
    Bases: type
    Metaclass for PyPy compatibility.
    PyPy does not work well with __slots__ and __class__ assignment.

    mro ()
    Return a type’s method resolution order.

SCons.compat.rename_module (new, old)
    Attempt to import the old module and load it under the new name. Used for purely cosmetic name changes in Python 3.x.
```

---

**Submodules**

**SCons.Action module**

SCons Actions.

Information about executing any sort of action that can build one or more target Nodes (typically files) from one or more source Nodes (also typically files) given a specific Environment.

The base class here is ActionBase. The base class supplies just a few utility methods and some generic methods for displaying information about an Action in response to the various commands that control printing.

A second-level base class is _ActionAction. This extends ActionBase by providing the methods that can be used to show and perform an action. True Action objects will subclass _ActionAction; Action factory class objects will subclass ActionBase.
The heavy lifting is handled by subclasses for the different types of actions we might execute:

    CommandAction CommandGeneratorAction FunctionAction ListAction

The subclasses supply the following public interface methods used by other modules:

    __call__()
    THE public interface, “calling” an Action object executes the command or Python function. This also takes
care of printing a pre-substitution command for debugging purposes.

    get_contents()
    Fetches the “contents” of an Action for signature calculation plus the varlist. This is what gets checksummed
to decide if a target needs to be rebuilt because its action changed.

    genstring()
    Returns a string representation of the Action without command substitution, but allows a
CommandGeneratorAction to generate the right action based on the specified target, source and env. This
is used by the Signature subsystem (through the Executor) to obtain an (imprecise) representation of the
Action operation for informative purposes.

Subclasses also supply the following methods for internal use within this module:

    __str__()
    Returns a string approximation of the Action; no variable substitution is performed.

    execute()
    The internal method that really, truly, actually handles the execution of a command or Python function. This
is used so that the __call__() methods can take care of displaying any pre-substitution representations, and
then execute an action without worrying about the specific Actions involved.

    get_presig()
    Fetches the “contents” of a subclass for signature calculation. The varlist is added to this to produce the
Action’s contents. TODO(?): Change this to always return bytes and not str?

    strfunction()
    Returns a substituted string representation of the Action. This is used by the _ActionAction.show() command to display the command/function that will be executed to generate the target(s).

There is a related independent ActionCaller class that looks like a regular Action, and which serves as a wrapper for
arbitrary functions that we want to let the user specify the arguments to now, but actually execute later (when an
out-of-date check determines that it’s needed to be executed, for example). Objects of this class are returned by an
ActionFactory class that provides a __call__() method as a convenient way for wrapping up the functions.

SCons.Action.Action (act, *args, **kw)
A factory for action objects.

class SCons.Action.Action
Bases: object
Base class for all types of action objects that can be held by other objects (Builders, Executors, etc.) This provides
the common methods for manipulating and combining those actions.

    batch_key (env, target, source)

    genstring (target, source, env)

    get_contents (target, source, env)

    get_targets (env, executor)
    Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

    get_varlist (target, source, env, executor=None)

    no_batch_key (env, target, source)

    presub_lines (env)
class SCons.Action.ActionCaller (parent, args, kw)
Bases: object
A class for delaying calling an Action function with specific (positional and keyword) arguments until the Action is actually executed.
This class looks to the rest of the world like a normal Action object, but what it’s really doing is hanging on to the arguments until we have a target, source and env to use for the expansion.

get_contents (target, source, env)

strfunction (target, source, env)

subst (s, target, source, env)

subst_args (target, source, env)

subst_kw (target, source, env)

class SCons.Action.ActionFactory (actfunc, strfunc, convert=<function ActionFactory.<lambda>>)
Bases: object
A factory class that will wrap up an arbitrary function as an SCons-executable Action object.
The real heavy lifting here is done by the ActionCaller class. We just collect the (positional and keyword) arguments that we’re called with and give them to the ActionCaller object we create, so it can hang onto them until it needs them.

class SCons.Action.CommandAction (cmd, **kw)
Bases: SCons.Action._ActionAction
Class for command-execution actions.

_get_implicit_deps_heavyweight (target, source, env, executor, icd_int)
Heavyweight dependency scanning involves scanning more than just the first entry in an action string. The exact behavior depends on the value of icd_int. Only files are taken as implicit dependencies; directories are ignored. If icd_int is an integer value, it specifies the number of entries to scan for implicit dependencies. Action strings are also scanned after a &&. So for example, if icd_int=2 and the action string is “cd <some_dir> && $PYTHON $SCRIPT_PATH <another_path>”, the implicit dependencies would be the path to the python binary and the path to the script. If icd_int is None, all entries are scanned for implicit dependencies.

_get_implicit_deps_lightweight (target, source, env, executor)
Lightweight dependency scanning involves only scanning the first entry in an action string, even if it contains &&.

batch_key (env, target, source)

execute (target, source, env, executor=None)
Execute a command action.
This will handle lists of commands as well as individual commands, because construction variable substitution may turn a single “command” into a list. This means that this class can actually handle lists of commands, even though that’s not how we use it externally.

genstring (target, source, env)

get_contents (target, source, env)

get_implicit_deps (target, source, env, executor=None)
Return the implicit dependencies of this action’s command line.

def get_presig (target, source, env, executor=None)
Return the signature contents of this action’s command line.
This strips $(-$) and everything in between the string, since those parts don’t affect signatures.

def get_targets (env, executor)
Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

get_varlist (target, source, env, executor=None)

no_batch_key (env, target, source)

presub_lines (env)

print_cmd_line (s, target, source, env)
   In python 3, and in some of our tests, sys.stdout is a String io object, and it takes unicode strings only. This code assumes s is a regular string.

process (target, source, env, executor=None)

strfunction (target, source, env, executor=None)

class SCons.Action.CommandGeneratorAction (generator, kw)
   Bases: SCons.Action.ActionBase
   Class for command-generator actions.

   _generate (target, source, env, for_signature, executor=None)

   batch_key (env, target, source)

   genstring (target, source, env, executor=None)

   get_contents (target, source, env)

   get_implicit_deps (target, source, env, executor=None)

   get_presig (target, source, env, executor=None)
      Return the signature contents of this action’s command line.
      This strips $(-$) and everything in between the string, since those parts don’t affect signatures.

   get_targets (env, executor)
      Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

   get_varlist (target, source, env, executor=None)

   no_batch_key (env, target, source)

   presub_lines (env)

class SCons.Action.FunctionAction (execfunction, kw)
   Bases: SCons.Action._ActionAction
   Class for Python function actions.

   batch_key (env, target, source)

   execute (target, source, env, executor=None)

   function_name ()

   genstring (target, source, env)

   get_contents (target, source, env)

   get_implicit_deps (target, source, env)

   get_presig (target, source, env)
      Return the signature contents of this callable action.
get_targets (env, executor)
Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

get_varlist (target, source, env, executor=None)

no_batch_key (env, target, source)

presub_lines (env)

print_cmd_line (s, target, source, env)
In python 3, and in some of our tests, sys.stdout is a String io object, and it takes unicode strings only This code assumes s is a regular string.

strfunction (target, source, env, executor=None)

class SCons.Action.LazyAction (var, kw)
A LazyAction is a kind of hybrid generator and command action for strings of the form “$VAR”. These strings normally expand to other strings (think “$CCCOM” to “$CC -c -o $TARGET $SOURCE”), but we also want to be able to replace them with functions in the construction environment. Consequently, we want lazy evaluation and creation of an Action in the case of the function, but that’s overkill in the more normal case of expansion to other strings.
So we do this with a subclass that’s both a generator and a command action. The overridden methods all do a quick check of the construction variable, and if it’s a string we just call the corresponding CommandAction method to do the heavy lifting. If not, then we call the same-named CommandGeneratorAction method. The CommandGeneratorAction methods work by using the overridden _generate() method, that is, our own way of handling “generation” of an action based on what’s in the construction variable.

__generate (target, source, env, for_signature, executor=None)

__generate_cache (env)

__get_implicit_deps_heavyweight (target, source, env, executor, icd_int)
Heavyweight dependency scanning involves scanning more than just the first entry in an action string. The exact behavior depends on the value of icd_int. Only files are taken as implicit dependencies; directories are ignored. If icd_int is an integer value, it specifies the number of entries to scan for implicit dependencies. Action strings are also scanned after a &amp;. So for example, if icd_int=2 and the action string is “cd <some_dir> &amp; $PYTHON $SCRIPT_PATH <another_path>”, the implicit dependencies would be the path to the python binary and the path to the script.
If icd_int is None, all entries are scanned for implicit dependencies.

__get_implicit_deps_lightweight (target, source, env, executor)
Lightweight dependency scanning involves only scanning the first entry in an action string, even if it contains &amp;.

execute (target, source, env, executor=None)
Execute a command action.
This will handle lists of commands as well as individual commands, because construction variable substitution may turn a single “command” into a list. This means that this class can actually handle lists of commands, even though that’s not how we use it externally.

genstring (target, source, env, executor=None)

get_contents (target, source, env)

get_implicit_deps (target, source, env, executor=None)
Return the implicit dependencies of this action’s command line.

get_parent_class (env)
**get_presig** (target, source, env)

Return the signature contents of this action’s command line.
This strips $(-$) and everything in between the string, since those parts don’t affect signatures.

**get_targets** (env, executor)

Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

**get_varlist** (target, source, env, executor=None)

**no_batch_key** (env, target, source)

**presub_lines** (env)

**print_cmd_line** (s, target, source, env)

In python 3, and in some of our tests, sys.stdout is a String io object, and it takes unicode strings only. This code assumes s is a regular string.

**process** (target, source, env, executor=None)

**strfunction** (target, source, env, executor=None)

**class** SCons.Action.ListAction (actionlist)

Bases: SCons.Action.ActionBase

Class for lists of other actions.

**batch_key** (env, target, source)

**genstring** (target, source, env)

**get_contents** (target, source, env)

**get_implicit_deps** (target, source, env)

**get_presig** (target, source, env)

Return the signature contents of this action list.
Simple concatenation of the signatures of the elements.

**get_targets** (env, executor)

Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.

**get_varlist** (target, source, env, executor=None)

**no_batch_key** (env, target, source)

**presub_lines** (env)

**class** SCons.Action._ActionAction (cmdstr=<class 'SCons.Action._null'>, strfunction=<class 'SCons.Action._null'>, varlist=(), presub=<class 'SCons.Action._null'>, chdir=None, exitstatfunc=None, batch_key=None, targets='$TARGETS', **kw)

Bases: SCons.Action.ActionBase

Base class for actions that create output objects.

**batch_key** (env, target, source)

**genstring** (target, source, env)

**get_contents** (target, source, env)

**get_targets** (env, executor)

Returns the type of targets ($TARGETS, $CHANGED_TARGETS) used by this action.
get_varlist (target, source, env, executor=None)

no_batch_key (env, target, source)

presub_lines (env)

print_cmd_line (s, target, source, env)

  In python 3, and in some of our tests, sys.stdout is a String io object, and it takes unicode strings only. This code assumes s is a regular string.

SCons.Action._actionAppend (act1, act2)

SCons.Action._callable_contents (obj)
  Return the signature contents of a callable Python object.

SCons.Action._code_contents (code, docstring=None)
  Return the signature contents of a code object.
  By providing direct access to the code object of the function, Python makes this extremely easy. Hooray!
  Unfortunately, older versions of Python include line number indications in the compiled byte code. Boo! So we
  remove the line number byte codes to prevent recompilations from moving a Python function.

  See:
  
  • https://docs.python.org/2/library/inspect.html

  For info on what each co_ variable provides
  The signature is as follows (should be byte/chars): co_argcount, len(co_varnames), len(co_cellvars),
  len(co_freevars), ( comma separated signature for each object in co_consts ), ( comma separated signature for
  each object in co_names ), ( The bytecode with line number bytecodes removed from co_code )
  co_argcount - Returns the number of positional arguments (including arguments with default values).
  co_varnames - Returns a tuple containing the names of the local variables (starting with the argument names).
  co_cellvars - Returns a tuple containing the names of local variables that are referenced by nested functions.
  co_freevars - Returns a tuple containing the names of free variables. (? ) co_consts - Returns a tuple containing
  the literals used by the bytecode. co_names - Returns a tuple containing the names used by the bytecode.
  co_code - Returns a string representing the sequence of bytecode instructions.

SCons.Action._do_create_action (act, kw)
  This is the actual “implementation” for the Action factory method, below. This handles the fact that passing lists to
  Action() itself has different semantics than passing lists as elements of lists.
  The former will create a ListAction, the latter will create a CommandAction by converting the inner list elements to
  strings.

SCons.Action._do_create_keywords (args, kw)
  This converts any arguments after the action argument into their equivalent keywords and adds them to the kw
  argument.

SCons.Action._do_create_list_action (act, kw)
  A factory for list actions. Convert the input list into Actions and then wrap them in a ListAction.

SCons.Action._function_contents (func)
  The signature is as follows (should be byte/chars): < _code_contents (see above) from func.__code__ > ,( comma
  separated _object_contents for function argument defaults) ,( comma separated _object_contents for any closure
  contents )

  See also: https://docs.python.org/3/reference/datamodel.html

  • func.__code__ - The code object representing the compiled function body.
  • func.__defaults__ - A tuple containing default argument values for those arguments that have defaults,
    or None if no arguments have a default value
  • func.__closure__ - None or a tuple of cells that contain bindings for the function’s free variables.

  Returns: Signature contents of a function. (in bytes)
SCons.Action._object_contents (obj)
Return the signature contents of any Python object.
We have to handle the case where object contains a code object since it can be pickled directly.

SCons.Action._object_instance_content (obj)
Returns consistent content for a action class or an instance thereof

Parameters:
- obj Should be either an action class or an instance thereof

Returns: bytearray or bytes representing the obj suitable for generating a signature from.

SCons.Action._string_from_cmd_list (cmd_list)
Takes a list of command line arguments and returns a pretty representation for printing.

SCons.Action._subproc (scons_env, cmd, error='ignore', **kw)
Wrapper for subprocess which pulls from construction env.
Use for calls to subprocess which need to interpolate values from an SCons construction environment into the
environment passed to subprocess. Adds an an error-handling argument. Adds ability to specify std(in,out,err) with
“devnull” tag.

SCons.Action.default_exitstatfunc (s)

SCons.Action.get_default_ENV (env)
A fiddlin’ little function that has an ‘import SCons.Environment’ which can’t be moved to the top level without
creating an import loop. Since this import creates a local variable named ‘SCons’, it blocks access to the global
variable, so we move it here to prevent complaints about local variables being used uninitialized.

SCons.Builder module

SCons.Builder
Builder object subsystem.

A Builder object is a callable that encapsulates information about how to execute actions to create a target Node
(file) from source Nodes (files), and how to create those dependencies for tracking.

The main entry point here is the Builder() factory method. This provides a procedural interface that creates the right
underlying Builder object based on the keyword arguments supplied and the types of the arguments.

The goal is for this external interface to be simple enough that the vast majority of users can create new Builders as
necessary to support building new types of files in their configurations, without having to dive any deeper into this
subsystem.

The base class here is BuilderBase. This is a concrete base class which does, in fact, represent the Builder objects
that we (or users) create.

There is also a proxy that looks like a Builder:

CompositeBuilder
This proxies for a Builder with an action that is actually a dictionary that knows how to map file suffixes to a
specific action. This is so that we can invoke different actions (compilers, compile options) for different
flavors of source files.

Builders and their proxies have the following public interface methods used by other modules:

- __call__()
  THE public interface. Calling a Builder object (with the use of internal helper methods) sets up the
target and source dependencies, appropriate mapping to a specific action, and the environment
manipulation necessary for overridden construction variable. This also takes care of warning about
possible mistakes in keyword arguments.

- add_emitter()
  Adds an emitter for a specific file suffix, used by some Tool modules to specify that (for example) a
  yacc invocation on a .y can create a .h and a .c file.

- add_action()
Adds an action for a specific file suffix, heavily used by Tool modules to add their specific action(s) for
turning a source file into an object file to the global static and shared object file Builders.

There are the following methods for internal use within this module:

- **_execute()**
  The internal method that handles the heavily lifting when a Builder is called. This is used so that the
  __call__() methods can set up warning about possible mistakes in keyword-argument overrides, and
  then execute all of the steps necessary so that the warnings only occur once.

- **get_name()**
  Returns the Builder’s name within a specific Environment, primarily used to try to return helpful
  information in error messages.

- **adjust_suffix()**
- **get_prefix()**
- **get_suffix()**
- **get_src_suffix()**
- **set_src_suffix()**

Miscellaneous stuff for handling the prefix and suffix manipulation we use in turning source file names
into target file names.

A factory for builder objects.

class SCons.Builder.BuilderBase (action=None, prefix='', suffix='', target_factory=None, source_factory=None, target_scanner=None, source_scanner=None, emitter=None, multi=0, env=None, single_source=0, name=None, chdir=<class 'SCons.Builder._Null'>, is_explicit=1, src_builder=None, ensure_suffix=False, **overrides)

| Bases: | object |

_class:_
Base class for Builders, objects that create output nodes (files) from input nodes (files).

- **_adjustixes** (files, pre, suf, ensure_suffix=False)
- **_create_nodes** (env, target=None, source=None)
  Create and return lists of target and source nodes.
- **_execute** (env, target, source, overwarn={}, executor_kw={})
- **_get_sdict** (env)
  Returns a dictionary mapping all of the source suffixes of all src_builders of this Builder to the underlying Builder
  that should be called first.
  This dictionary is used for each target specified, so we save a lot of extra computation by memoizing it for each
  construction environment.
  Note that this is re-computed each time, not cached, because there might be changes to one of our source
  Builders (or one of their source Builders, and so on, and so on...) that we can’t “see.”
  The underlying methods we call cache their computed values, though, so we hope repeatedly aggregating them
  into a dictionary like this won’t be too big a hit. We may need to look for a better way to do this if performance
  data show this has turned into a significant bottleneck.

- **_get_src_builders_key** (env)
- **_subst_src_suffixes_key** (env)

_add_emitter** (suffix, emitter)
Add a suffix-emitter mapping to this Builder.
This assumes that emitter has been initialized with an appropriate dictionary type, and will throw a TypeError if
not, so the caller is responsible for knowing that this is an appropriate method to call for the Builder in question.

_add_src_builder** (builder)
Add a new Builder to the list of src_builders. This requires wiping out cached values so that the computed lists of source suffixes get re-calculated.

`adjust_suffix(suff)`

`get_name(env)`
Attempts to get the name of the Builder. Look at the BUILDERS variable of env, expecting it to be a dictionary containing this Builder, and return the key of the dictionary. If there’s no key, then return a directly-configured name (if there is one) or the name of the class (by default).

`get_prefix(env, sources=[])`

`get_src Builders(env)`
Returns the list of source Builders for this Builder. This exists mainly to look up Builders referenced as strings in the ‘BUILDERS’ variable of the construction environment and cache the result.

`get_src_suffix(env)`
Get the first src_suffix in the list of src_suffixes.

`get_suffix(env, sources=[])`

`set_src_suffix(src_suffix)`

`set_suffix(suffix)`

`splitext(path, env=None)`

`src_builder_sources(env, source, overwarn={})`

`src_suffixes(env)`
Returns the list of source suffixes for all src_builders of this Builder. This is essentially a recursive descent of the src_builder “tree.” (This value isn’t cached because there may be changes in a src_builder many levels deep that we can’t see.)

`subst_src_suffixes(env)`
The suffix list may contain construction variable expansions, so we have to evaluate the individual strings. To avoid doing this over and over, we memoize the results for each construction environment.

### SCons.Builder.CallableSelector

Bases: SCons.Util.Selector
A callable dictionary that will, in turn, call the value it finds if it can.

`clear()` → None. Remove all items from od.

`copy()` → a shallow copy of od

`fromkeys(value=None)`
Create a new ordered dictionary with keys from iterable and values set to value.

`get(key, default=None, /)`
Return the value for key if key is in the dictionary, else default.

`items()` → a set-like object providing a view on D’s items

`keys()` → a set-like object providing a view on D’s keys

`move_to_end(key, last=True)`
Move an existing element to the end (or beginning if last is false). Raise KeyError if the element does not exist.
**pop** (k[, d]) → v, remove specified key and return the corresponding value. If key is not found, d is returned if given, otherwise KeyError is raised.

**popitem**(last=True)
Remove and return a (key, value) pair from the dictionary.
Pairs are returned in LIFO order if last is true or FIFO order if false.

**setdefault**(key, default=None)
Insert key with a value of default if key is not in the dictionary.
Return the value for key if key is in the dictionary, else default.

**update** ([, E], **F)** → None. Update D from dict/iterable E and F.
If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

**values** () → an object providing a view on D's values

**class** SCons.Builder.CompositeBuilder (builder, cmdgen)
**Bases:** SCons.Util.Proxy
A Builder Proxy whose main purpose is to always have a DictCmdGenerator as its action, and to provide access to the DictCmdGenerator's add_action() method.

**add_action**(suffix, action)

**get**( )
Retrieve the entire wrapped object

**class** SCons.Builder.DictCmdGenerator (dict=None, source_ext_match=1)
**Bases:** SCons.Util.Selector
This is a callable class that can be used as a command generator function. It holds on to a dictionary mapping file suffixes to Actions. It uses that dictionary to return the proper action based on the file suffix of the source file.

**add_action**(suffix, action)
Add a suffix-action pair to the mapping.

**clear**( ) → None. Remove all items from od.

**copy**( ) → a shallow copy of od

**fromkeys**( value=None)
Create a new ordered dictionary with keys from iterable and values set to value.

**get**(key, default=None, /)
Return the value for key if key is in the dictionary, else default.

**items**( ) → a set-like object providing a view on D's items

**keys**( ) → a set-like object providing a view on D's keys

**move_to_end**(key, last=True)
Move an existing element to the end (or beginning if last is false).
Raise KeyError if the element does not exist.

**pop** (k[, d]) → v, remove specified key and return the corresponding value. If key is not found, d is returned if given, otherwise KeyError is raised.

**popitem**(last=True)
Remove and return a (key, value) pair from the dictionary.
Pairs are returned in LIFO order if last is true or FIFO order if false.

**setdefault**(key, default=None)
Insert key with a value of default if key is not in the dictionary.
Return the value for key if key is in the dictionary, else default.

```
src_suffixes()
```

```
update ([], **F) → None. Update D from dict/iterable E and F.
If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys()
method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]
```

values() → an object providing a view on D’s values

class SCons.Builder.DictEmitter
Bases: SCons.Util.Selector
A callable dictionary that maps file suffixes to emitters. When called, it finds the right emitter in its dictionary for the
suffix of the first source file, and calls that emitter to get the right lists of targets and sources to return. If there’s no
emitter for the suffix in its dictionary, the original target and source are returned.

clear() → None. Remove all items from od.
copy() → a shallow copy of od
fromkeys (value=None)
Create a new ordered dictionary with keys from iterable and values set to value.

get(key, default=None, /)
Return the value for key if key is in the dictionary, else default.

items() → a set-like object providing a view on D’s items

keys() → a set-like object providing a view on D’s keys

move_to_end(key, last=True)
Move an existing element to the end (or beginning if last is false).
Raise KeyError if the element does not exist.

pop(key, d=None) → v, remove specified key and return the corresponding
value. If key is not found, d is returned if given, otherwise KeyError is raised.

popitem(last=True)
Remove and return a (key, value) pair from the dictionary.
Pairs are returned in LIFO order if last is true or FIFO order if false.

setdefault(key, default=None)
Insert key with a value of default if key is not in the dictionary.
Return the value for key if key is in the dictionary, else default.

update ([], **F) → None. Update D from dict/iterable E and F.
If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys()
method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

values() → an object providing a view on D’s values

class SCons.Builder.EmitterProxy (var)
Bases: object
This is a callable class that can act as a Builder emitter. It holds on to a string that is a key into an Environment
dictionary, and will look there at actual build time to see if it holds a callable. If so, we will call that as the actual
emitter.

class SCons.Builder.ListEmitter (initlist=None)
Bases: collections.UserList
A callable list of emitters that calls each in sequence, returning the result.
append (item)
    S.append(value) – append value to the end of the sequence

clear () → None – remove all items from S

copy ()

count (value) → integer – return number of occurrences of value

extend (other)
    S.extend(iterable) – extend sequence by appending elements from the iterable

index (value[, start[, stop]]) → integer – return first index of value.
    Raises ValueError if the value is not present.
    Supporting start and stop arguments is optional, but recommended.

insert (i, item)
    S.insert(index, value) – insert value before index

pop ([, index]) → item – remove and return item at index (default last).
    Raise IndexError if list is empty or index is out of range.

remove (item)
    S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
    S.reverse() – reverse IN PLACE

sort (*args, **kwds)

class SCons.Builder.OverrideWarner (dict)
    Bases: collections.UserDict
    A class for warning about keyword arguments that we use as overrides in a Builder call.
    This class exists to handle the fact that a single Builder call can actually invoke multiple builders. This class only
    emits the warnings once, no matter how many Builders are invoked.
If E present and has a .keys() method, does: for k in E: D[k] = E[k] If E present and lacks .keys() method, does: for (k, v) in E: D[k] = v In either case, this is followed by: for k, v in F.items(): D[k] = v

`values()` → an object providing a view on D’s values

`warn()`

class SCons.Builder._Null
   Bases: object

SCons.Builder._node_errors (builder, env, tlist, slist)
   Validate that the lists of target and source nodes are legal for this builder and environment. Raise errors or issue warnings as appropriate.

SCons.Builder._null
   alias of SCons.Builder._Null

SCons.Builder.is_a_Builder (obj)
   “Returns True if the specified obj is one of our Builder classes. The test is complicated a bit by the fact that CompositeBuilder is a proxy, not a subclass of BuilderBase.

SCons.Builder.match_splitext (path, suffixes=[])

[SCons.CacheDir module]

CacheDir support

class SCons.CacheDir.CacheDir (path)
   Bases: object

   CacheDebug (fmt, target, cachefile)

   _readconfig (path)
      Read the cache config.
      If directory or config file do not exist, create. Take advantage of Py3 capability in os.makedirs() and in file open(): just try the operation and handle failure appropriately. Omit the check for old cache format, assume that’s old enough there will be none of those left to worry about.

      Parameters:  path – path to the cache directory

   cachepath (node)

   classmethod copy_from_cache (env, src, dst)

   classmethod copy_to_cache (env, src, dst)

   get_cachedir_csig (node)

   property hit_ratio
      is_enabled()

   is_readonly()

   property misses

   push (node)

   push_if_forced (node)

   retrieve (node)
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built()

Note that there's a special trick here with the execute flag (one that's not normally done for other actions). Basically if the user requested a no_exec (-n) build, then SCons.Action.execute_actions is set to 0 and when any action is called, it does its showing but then just returns zero instead of actually calling the action execution operation. The problem for caching is that if the file does NOT exist in cache then the CacheRetrieveString won't return anything to show for the task, but the Action._call_ won't call CacheRetrieveFunc; instead it just returns zero, which makes the code below think that the file was successfully retrieved from the cache, therefore it doesn't do any subsequent building. However, the CacheRetrieveString didn't print anything because it didn't actually exist in the cache, and no more build actions will be performed, so the user just sees nothing. The fix is to tell Action._call_ to always execute the CacheRetrieveFunc and then have the latter explicitly check SCons.Action.execute_actions itself.

SCons.CacheDir.CachePushFunc (target, source, env)
SCons.CacheDir.CacheRetrieveFunc (target, source, env)
SCons.CacheDir.CacheRetrieveString (target, source, env)

**SCons.Conftest module**

Autoconf-like configuration support

The purpose of this module is to define how a check is to be performed.

A context class is used that defines functions for carrying out the tests, logging and messages. The following methods and members must be present:

context.Display(msg)
Function called to print messages that are normally displayed for the user. Newlines are explicitly used. The text should also be written to the logfile!

context.Log(msg)
Function called to write to a log file.

context.BuildProg(text, ext)
Function called to build a program, using "ext" for the file extension. Must return an empty string for success, an error message for failure. For reliable test results building should be done just like an actual program would be build, using the same command and arguments (including configure results so far).

context.CompileProg(text, ext)
Function called to compile a program, using "ext" for the file extension. Must return an empty string for success, an error message for failure. For reliable test results compiling should be done just like an actual source file would be compiled, using the same command and arguments (including configure results so far).

context.AppendLIBS(lib_name_list)
Append “lib_name_list” to the value of LIBS. “lib_name_list” is a list of strings. Return the value of LIBS before changing it (any type can be used, it is passed to SetLIBS() later.)

context.PrependLIBS(lib_name_list)
Prepend “lib_name_list” to the value of LIBS. “lib_name_list” is a list of strings. Return the value of LIBS before changing it (any type can be used, it is passed to SetLIBS() later.)

context.SetLIBS(value)
Set LIBS to “value”. The type of “value” is what AppendLIBS() returned. Return the value of LIBS before changing it (any type can be used, it is passed to SetLIBS() later.)

context.headerfilename
Name of file to append configure results to, usually “confdefs.h”. The file must not exist or be empty when starting. Empty or None to skip this (some tests will not work!).

context.config_h (may be missing).
If present, must be a string, which will be filled with the contents of a config_h file.

context.vardict
Dictionary holding variables used for the tests and stores results from the tests, used for the build commands. Normally contains “CC”, “LIBS”, “CPPFLAGS”, etc.
**context.havedict**

Dictionary holding results from the tests that are to be used inside a program. Names often start with "HAVE_". These are zero (feature not present) or one (feature present). Other variables may have any value, e.g., "PERLVERSION" can be a number and "SYSTEMNAME" a string.

**SCons.Conftest.CheckBuilder** (context, text=None, language=None)
Configure check to see if the compiler works. Note that this uses the current value of compiler and linker flags, make sure $CFLAGS, $CPPFLAGS and $LIBS are set correctly. “language” should be “C” or “C++” and is used to select the compiler. Default is “C”. “text” may be used to specify the code to be build. Returns an empty string for success, an error message for failure.

**SCons.Conftest.CheckCC** (context)
Configure check for a working C compiler.
This checks whether the C compiler, as defined in the $CC construction variable, can compile a C source file. It uses the current $CCCOM value too, so that it can test against non working flags.

**SCons.Conftest.CheckCXX** (context)
Configure check for a working CXX compiler.
This checks whether the CXX compiler, as defined in the $CXX construction variable, can compile a CXX source file. It uses the current $CXXCOM value too, so that it can test against non working flags.

**SCons.Conftest.CheckDeclaration** (context, symbol, includes=None, language=None)
Checks whether symbol is declared.
Use the same test as autoconf, that is test whether the symbol is defined as a macro or can be used as an r-value.

**Parameters:**
- **symbol** – str the symbol to check
- **includes** – str Optional “header” can be defined to include a header file.
- **language** – str only C and C++ supported.

**Returns:** bool True if the check failed, False if succeeded.

**Return type:** status

**SCons.Conftest.CheckFunc** (context, function_name, header=None, language=None)
Configure check for a function “function_name”. “language” should be “C” or “C++” and is used to select the compiler. Default is “C”. Optional “header” can be defined to define a function prototype, include a header file or anything else that comes before main(). Sets HAVE_function_name in context.havedict according to the result. Note that this uses the current value of compiler and linker flags, make sure $CFLAGS, $CPPFLAGS and $LIBS are set correctly. Returns an empty string for success, an error message for failure.

**SCons.Conftest.CheckHeader** (context, header_name, header=None, language=None, include_quotes=None)
Configure check for a C or C++ header file “header_name”. Optional “header” can be defined to do something before including the header file (unusual, supported for consistency). “language” should be “C” or “C++” and is used to select the compiler. Default is “C”. Sets HAVE_header_name in context.havedict according to the result. Note that this uses the current value of compiler and linker flags, make sure $CFLAGS and $CPPFLAGS are set correctly. Returns an empty string for success, an error message for failure.

**SCons.Conftest.CheckLib** (context, libs, func_name=None, header=None, extra_libs=None, call=None, language=None, autoadd=1, append=True)
Configure check for a C or C++ libraries “libs”. Searches through the list of libraries, until one is found where the test succeeds. Tests if “func_name” or “call” exists in the library. Note: if it exists in another library the test succeeds anyway! Optional “header” can be defined to include a header file. If not given a default prototype for “func_name” is added. Optional “extra_libs” is a list of library names to be added after “lib_name” in the build command. To be used for libraries that “lib_name” depends on. Optional “call” replaces the call to “func_name” in the test code. It must consist of complete C statements, including a trailing “;”. Both “func_name” and “call” arguments are optional, and in that case, just linking against the lib is tested. “language” should be “C” or “C++” and is used to select the compiler. Default is “C”. Note that this uses the current value of compiler and linker flags, make sure $CFLAGS, $CPPFLAGS and $LIBS are set correctly. Returns an empty string for success, an error message for failure.

**SCons.Conftest.CheckProg** (context, prog_name)
Configure check for a specific program.
Check whether program prog_name exists in path. If it is found, returns the path for it, otherwise returns None.

**SCons.Conftest.CheckSHCC** (context)
Configure check for a working shared C compiler. This checks whether the C compiler, as defined in the $SHCC construction variable, can compile a C source file. It uses the current $SHCCCOM value too, so that it can test against non working flags.

SCons.Conftest.CheckSHCXX (context)
Configure check for a working shared CXX compiler. This checks whether the CXX compiler, as defined in the $SHCXX construction variable, can compile a CXX source file. It uses the current $SHCXXCOM value too, so that it can test against non working flags.

SCons.Conftest.CheckType (context, type_name, fallback=None, header=None, language=None)
Configure check for a C or C++ type “type_name”. Optional “header” can be defined to include a header file. “language” should be “C” or “C++” and is used to select the compiler. Default is “C”. Sets HAVE_type_name in context.havedict according to the result. Note that this uses the current value of compiler and linker flags, make sure $CFLAGS, $CPPFLAGS and $LIBS are set correctly. Returns an empty string for success, an error message for failure.

SCons.Conftest.CheckTypeSize (context, type_name, header=None, language=None, expect=None)
This check can be used to get the size of a given type, or to check whether the type is of expected size.

Parameters:
- **type** (-) – str the type to check
- **includes** (-) – sequence list of headers to include in the test code before testing the type
- **language** (-) – str ‘C’ or ‘C++’
- **expect** (-) – int if given, will test wether the type has the given number of bytes. If not given, will automatically find the size.
- **Returns** – statusint0 if the check failed, or the found size of the type if the check succeeded.

SCons.Conftest._Have (context, key, have, comment=None)
Store result of a test in context.havedict and context.headerfilename.

Parameters:
- **key** - is a “HAVE_abc” name. It is turned into all CAPITALS and non-alphanumerics are replaced by an underscore.
- **have** - value as it should appear in the header file, include quotes when desired and escape special characters!
- **comment** is the C comment to add above the line defining the symbol (the comment is automatically put inside a /* */). If None, no comment is added.

The value of “have” can be:
- **1** - Feature is defined, add “#define key”.
- **0** - Feature is not defined, add “/* #undef key */”. Adding “undef” is what autoconf does. Not useful for the compiler, but it shows that the test was done.
- **number** - Feature is defined to this number “#define key have”. Doesn’t work for 0 or 1, use a string then.
- **string** - Feature is defined to this string “#define key have”.

SCons.Conftest._LogFailed (context, text, msg)
Write to the log about a failed program. Add line numbers, so that error messages can be understood.

SCons.Conftest._YesNoResult (context, ret, key, text, comment=None)
Handle the result of a test with a “yes” or “no” result.

Parameters:
- **ret** is the return value: empty if OK, error message when not.
- **key** is the name of the symbol to be defined (HAVE.foo).
- **text** is the source code of the program used for testing.
- **comment** is the C comment to add above the line defining the symbol (the comment is automatically put inside a /* */). If None, no comment is added.
SCons.Conftest._check_empty_program (context, comp, text, language, use_shared=False)
Return 0 on success, 1 otherwise.

SCons.Conftest._lang2suffix (lang)
Convert a language name to a suffix. When “lang” is empty or None C is assumed. Returns a tuple (lang, suffix, None) when it works. For an unrecognized language returns (None, None, msg).

Where:
- lang = the unified language name
- suffix = the suffix, including the leading dot
- msg = an error message

**SCons.Debug module**

Code for debugging SCons internal things.

Shouldn’t be needed by most users. Quick shortcuts:
from SCons.Debug import caller_trace caller_trace()

SCons.Debug.Trace (msg, tracefile=None, mode='w', tstamp=False)
Write a trace message.
Write messages when debugging which do not interfere with stdout. Useful in tests, which monitor stdout and would break with unexpected output. Trace messages can go to the console (which is opened as a file), or to a disk file; the tracefile argument persists across calls unless overridden.

Parameters:
- tracefile – file to write trace message to. If omitted, write to the previous trace file (default: console).
- mode – file open mode (default: ‘w’)
- tstamp – write relative timestamps with trace. Outputs time since scons was started, and time since last trace (default: False)

SCons.Debug._dump_one_caller (key, file, level=0)
SCons.Debug.caller_stack ()
return caller’s stack

SCons.Debug.caller_trace (back=0)
Trace caller stack and save info into global dicts, which are printed automatically at the end of SCons execution.

SCons.Debug.countLoggedInstances (classes, file<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>)

SCons.Debug.dumpLoggedInstances (classes, file<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>)

SCons.Debug.dump_caller_counts (file<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>)

SCons.Debug.fetchLoggedInstances (classes='*

SCons.Debug.func_shorten (func_tuple)

SCons.Debug.listLoggedInstances (classes, file<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>)

SCons.Debug.logInstanceCreation (instance, name=None)

SCons.Debug.memory ()

SCons.Debug.string_to_classes (s)

**SCons.Defaults module**

Builders and other things for the local site.
Here's where we'll duplicate the functionality of autoconf until we move it into the installation procedure or use something like qmconf.

The code that reads the registry to find MSVC components was borrowed from distutils.msvccompiler.

SCons.Defaults.DefaultEnvironment (*args, **kw)
Initial public entry point for creating the default construction Environment.

After creating the environment, we overwrite our name (DefaultEnvironment) with the _fetch_DefaultEnvironment() function, which more efficiently returns the initialized default construction environment without checking for its existence.

(This function still exists with its _default_check because someone else (cough Script/_init__.py cough) may keep a reference to this function. So we can't use the fully functional idiom of having the name originally be a something that only creates the construction environment and then overwrites the name.)

class SCons.Defaults.NullCmdGenerator (cmd)
Bases: object
This is a callable class that can be used in place of other command generators if you don’t want them to do anything.

The __call__ method for this class simply returns the thing you instantiated it with.

Example usage: env["DO_NOTHING"] = NullCmdGenerator
env["LINKCOM"] = "${DO_NOTHING($LINK $SOURCES $TARGET})"

SCons.Defaults.SharedFlagChecker (source, target, env)
SCons.Defaults.SharedObjectEmitter (target, source, env)
SCons.Defaults.StaticObjectEmitter (target, source, env)

class SCons.Defaults.Variable_Method_Caller (variable, method)
Bases: object
A class for finding a construction variable on the stack and calling one of its methods.

We use this to support “construction variables” in our string eval()s that actually stand in for methods—specifically, use of “RDirs” in call to _concat that should actually execute the “TARGET.RDirs” method. (We used to support this by creating a little “build dictionary” that mapped RDirs to the method, but this got in the way of Memoizing construction environments, because we had to create new environment objects to hold the variables.)

SCons.Defaults.__lib Either Version Flag (env, version_var1, version_var2, flags_var)
if $version_var1 or $version_var2 is not empty, returns env[flags_var], otherwise returns None

SCons.Defaults.__libversionflags (env, version_var, flags_var)
if version_var is not empty, returns env[flags_var], otherwise returns None

SCons.Defaults._concat (prefix, items_iter, suffix, env, f=<function _concat_ixes>, target=None, source=None, affect_signature=True)
Creates a new list from ‘items_iter’ by first interpolating each element in the list using the ‘env’ dictionary and then calling f on the list, and finally calling _concat_ixes to concatenate ‘prefix’ and ‘suffix’ onto each element of the list.

SCons.Defaults._concat_ixes (prefix, items_iter, suffix, env)
Creates a new list from ‘items_iter’ by concatenating the ‘prefix’ and ‘suffix’ arguments onto each element of the list. A trailing space on ‘prefix’ or leading space on ‘suffix’ will cause them to be put into separate list elements rather than being concatenated.

SCons.Defaults._defines (prefix, defs, suffix, env, target, source, c=<function _concat_ixes>)
A wrapper around _concat_ixes that turns a list or string into a list of C preprocessor command-line definitions.

SCons.Defaults._fetch_DefaultEnvironment (*args, **kw)
Returns the already-created default construction environment.

SCons.Defaults._stripixes (prefix, items, suffix, strip prefixes, strip suffixes, env, c=None)
This is a wrapper around _concat()/_concat_ixes() that checks for the existence of prefixes or suffixes on list items and strips them where it finds them. This is used by tools (like the GNU linker) that need to turn something like ‘libfoo.a’ into ‘-lfoo’.

SCons.Defaults.chmod_func (dest, mode)
SCons.Defaults.chmod_strfunc (dest, mode)

SCons.Defaults.copy_func (dest, src, symlinks=True)

If symlinks (is true), then a symbolic link will be shallow copied and recreated as a symbolic link; otherwise, copying a symbolic link will be equivalent to copying the symbolic link's final target regardless of symbolic link depth.

SCons.Defaults.delete_func (dest, must_exist=0)

SCons.Defaults.delete_strfunc (dest, must_exist=0)

SCons.Defaults.get_paths_str (dest)

SCons.Defaults.mkdir_func (dest)

SCons.Defaults.move_func (dest, src)

SCons.Defaults.processDefines (defs)

Process defines, resolving strings, lists, dictionaries, into a list of strings

SCons.Defaults.touch_func (dest)

### SCons.Environment module

Base class for construction Environments.

These are the primary objects used to communicate dependency and construction information to the build engine.

Keyword arguments supplied when the construction Environment is created are construction variables used to initialize the Environment.

class SCons.Environment.Base (platform=None, tools=None, toolpath=None, variables=None, parse_flags=None, **kw)

    Bases: SCons.Environment.SubstitutionEnvironment
    Base class for "real" construction Environments.
    These are the primary objects used to communicate dependency and construction information to the build engine.
    Keyword arguments supplied when the construction Environment is created are construction variables used to initialize the Environment.

    Action (*args, **kw)

    AddMethod (function, name=None)
    Adds the specified function as a method of this construction environment with the specified name. If the name is omitted, the default name is the name of the function itself.

    AddPostAction (files, action)

    AddPreAction (files, action)

    Alias (target, source=[], action=None, **kw)

    AlwaysBuild (*targets)

    Append (**kw)
    Append values to construction variables in an Environment.
    The variable is created if it is not already present.

    AppendENVPath (name, newpath, envname='ENV', sep=':', delete_existing=0)
    Append path elements to the path 'name' in the 'ENV' dictionary for this environment. Will only add any particular path once, and will normpath and normcase all paths to help assure this. This can also handle the case where the env variable is a list instead of a string.
    If delete_existing is 0, a newpath which is already in the path will not be moved to the end (it will be left where it is).

    AppendUnique (delete_existing=0, **kw)
Append values to existing construction variables in an Environment, if they’re not already there. If delete_existing is 1, removes existing values first, so values move to end.

**Builder (**kw)**

**CacheDir** (path, custom_class=None)

**Clean** (targets, files)

**Clone** (tools=[], toolpath=None, parse_flags=None, **kw)

Return a copy of a construction Environment.

The copy is like a Python “deep copy”—that is, independent copies are made recursively of each objects—except that a reference is copied when an object is not deep-copyable (like a function). There are no references to any mutable objects in the original Environment.

**Command** (target, source, action, **kw)

Builds the supplied target files from the supplied source files using the supplied action. Action may be any type that the Builder constructor will accept for an action.

**Configure** (*args, **kw)**

**Decider** (function)

**Depends** (target, dependency)

Explicitly specify that ‘target’ is dependent on ‘dependency’.

**Detect** (progs)

Return the first available program from one or more possibilities.

**Parameters:** progs (str or list) – one or more command names to check for

**Dictionary** (*args)

Return construction variables from an environment.

**Parameters:** *args (optional) – variable names to look up

**Returns:** If *args omitted, the dictionary of all construction variables. If one arg, the corresponding value is returned. If more than one arg, a list of values is returned.

**Raises:** KeyError – if any of *args is not in the construction environment.

**Dir** (name, *args, **kw)

**Dump** (key=None, format='pretty')

Return construction variables serialized to a string.

**Parameters:**

- key (optional) – if None, format the whole dict of variables. Else format the value of key (Default value = None)
- format (str, optional) – specify the format to serialize to. “pretty” generates a pretty-printed string, “json” a JSON-formatted string. (Default value = “pretty”)

**Entry** (name, *args, **kw)

**Environment** (**kw)**

**Execute** (action, *args, **kw)

Directly execute an action through an Environment

**File** (name, *args, **kw)

**FindFile** (file, dirs)
**FindInstalledFiles()**
returns the list of all targets of the Install and InstallAs Builder.

**FindIxes (paths, prefix, suffix)**
Search a list of paths for something that matches the prefix and suffix.

*Parameters:*
- **paths** – the list of paths or nodes.
- **prefix** – construction variable for the prefix.
- **suffix** – construction variable for the suffix.

*Returns:* the matched path or None

**FindSourceFiles (node=\'.\')**
returns a list of all source files.

**Flatten (sequence)**

**GetBuildPath (files)**

**Glob (pattern, ondisk=True, source=False, strings=False, exclude=None)**

**Ignore (target, dependency)**
Ignore a dependency.

**Literal (string)**

**Local (*targets)**

**MergeFlags (args, unique=True)**
Merge flags into construction variables.
Merges the flags from `args` into this construction environment. If `args` is not a dict, it is first converted to a
dictionary with flags distributed into appropriate construction variables. See **ParseFlags()**.

*Parameters:*
- **args** – flags to merge
- **unique** – merge flags rather than appending (default: True)

**NoCache (*targets)**
Tags a target so that it will not be cached

**NoClean (*targets)**
Tags a target so that it will not be cleaned by -c

**Override (overrides)**
Produce a modified environment whose variables are overridden by the overrides dictionaries. “overrides” is a
dictionary that will override the variables of this environment.
This function is much more efficient than Clone() or creating a new Environment because it doesn’t copy the
construction environment dictionary, it just wraps the underlying construction environment, and doesn’t even
create a wrapper object if there are no overrides.

**ParseConfig (command, function=None, unique=True)**
Use the specified function to parse the output of the command in order to modify the current environment. The
‘command’ can be a string or a list of strings representing a command and its arguments. ‘Function’ is an
optional argument that takes the environment, the output of the command, and the unique flag. If no function is
specified, MergeFlags, which treats the output as the result of a typical ‘X-config’ command (i.e. gtk-config), will
merge the output into the appropriate variables.

**ParseDepends (filename, must_exist=None, only_one=False)**
Parse a mkdep-style file for explicit dependencies. This is completely abusable, and should be unnecessary in the
“normal” case of proper SCons configuration, but it may help make the transition from a Make hierarchy
easier for some people to swallow. It can also be genuinely useful when using a tool that can write a .d file, but
for which writing a scanner would be too complicated.

ParseFlags(*flags)
Return a dict of parsed flags.
Parse flags and return a dict with the flags distributed into the appropriate construction variable names. The
flags are treated as a typical set of command-line flags for a GNU-like toolchain, such as might have been
generated by one of the (foo)-config scripts, and used to populate the entries based on knowledge embedded in
this method - the choices are not expected to be portable to other toolchains.
If one of the flags strings begins with a bang (exclamation mark), it is assumed to be a command and the rest
of the string is executed; the result of that evaluation is then added to the dict.

Platform(platform)

Precious(*targets)

Prepend(**kw)
Prepend values to construction variables in an Environment.
The variable is created if it is not already present.

PrependENVPath(name, newpath, envname='ENV', sep=';', delete_existing=1)
Prepend path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any
particular path once, and will normpath and normcase all paths to help assure this. This can also handle the
case where the env variable is a list instead of a string.
If delete_existing is 0, a newpath which is already in the path will not be moved to the front (it will be left where it
is).

PrependUnique(delete_existing=0, **kw)
Prepend values to existing construction variables in an Environment, if they’re not already there. If
delete_existing is 1, removes existing values first, so values move to front.

Pseudo(*targets)

PyPackageDir(modulename)

RemoveMethod(function)
Removes the specified function’s MethodWrapper from the added_methods list, so we don’t re-bind it when
making a clone.

Replace(**kw)
Replace existing construction variables in an Environment with new construction variables and/or values.

ReplaceIxes(path, old_prefix, old_suffix, new_prefix, new_suffix)
Replace old_prefix with new_prefix and old_suffix with new_suffix.
env - Environment used to interpolate variables. path - the path that will be modified. old_prefix - construction
variable for the old prefix. old_suffix - construction variable for the old suffix. new_prefix - construction variable
for the new prefix. new_suffix - construction variable for the new suffix.

Repository(*dirs, **kw)

Requires(target, prerequisite)
Specify that ‘prerequisite’ must be built before ‘target’, (but ‘target’ does not actually depend on ‘prerequisite’
and need not be rebuilt if it changes).

SConsignFile(name='.sconsign', dbm_module=None)

Scanner(*args, **kw)

SetDefault(**kw)

SideEffect(side_effect, target)
Tell scons that side_effects are built as side effects of building targets.

**Split** (arg)
This function converts a string or list into a list of strings or Nodes. This makes things easier for users by allowing files to be specified as a white-space separated list to be split.

The input rules are:

- A single string containing names separated by spaces. These will be split apart at the spaces.
- A single Node instance
- A list containing either strings or Node instances. Any strings in the list are not split at spaces. In all cases, the function returns a list of Nodes and strings.

**Tool** (tool, toolpath=None, **kwargs) → SCons.Tool.Tool

**Value** (value, built_value=None, name=None)

**VariantDir** (variant_dir, src_dir, duplicate=1)

**WhereIs** (prog, path=None, pathext=None, reject=None)
Find prog in the path.

**_canonicalize** (path)
Allow Dirs and strings beginning with # for top-relative. Note this uses the current env’s fs (in self).

**_changed_build** (dependency, target, prev_ni, repo_node=None)

**_changed_content** (dependency, target, prev_ni, repo_node=None)

**_changed_source** (dependency, target, prev_ni, repo_node=None)

**_changed_timestamp_match** (dependency, target, prev_ni, repo_node=None)

**_changed_timestamp_newer** (dependency, target, prev_ni, repo_node=None)

**_changed_timestamp_then_content** (dependency, target, prev_ni, repo_node=None)

**_find_toolpath_dir** (p)

**_gsm** ()

**_init_special** ()
Initial the dispatch tables for special handling of special construction variables.

**_update** (other)
Private method to update an environment’s consvar dict directly. Bypasses the normal checks that occur when users try to set items.

**_update_onlynew** (other)
Private method to add new items to an environment’s consvar dict. Only adds items from other whose keys do not already appear in the existing dict; values from other are not used for replacement. Bypasses the normal checks that occur when users try to set items.

**arg2nodes** (args, node_factory=<class 'SCons.Environment._Null'>, lookup_list=<class 'SCons.Environment._Null'>, **kw)

**backtick** (command)

**get** (key, default=None)
Emulates the get() method of dictionaries.

get_CacheDir()

get_builder (name)
Fetch the builder with the specified name from the environment.

get_factory (factory, default='File')
Return a factory function for creating Nodes for this construction environment.

get_scanner (skey)
Find the appropriate scanner given a key (usually a file suffix).

get_src_sig_type()

get_tgt_sig_type()

gvars()

items()
Emulates the items() method of dictionaries.

keys()
Emulates the keys() method of dictionaries.

lvars()

scanner_map_delete (kw=None)
Delete the cached scanner map (if we need to).

setdefault (key, default=None)
Emulates the setdefault() method of dictionaries.

subst (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

subst_kw (kw, raw=0, target=None, source=None)

subst_list (string, raw=0, target=None, source=None, conv=None, executor=None)
Calls through to SCons.Subst.scons__subst_list(). See the documentation for that function.

subst_path (path, target=None, source=None)
Substitute a path list, turning EntryProxies into Nodes and leaving Nodes (and other objects) as-is.

subst_target_source (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

validate_CacheDir_class (custom_class=None)
Validate the passed custom CacheDir class, or if no args are passed, validate the custom CacheDir class from the environment.

values()
Emulates the values() method of dictionaries.

class SCons.Environment.BuilderDict (dict, env)
Bases: `collections.UserDict`

This is a dictionary-like class used by an Environment to hold the Builders. We need to do this because every time someone changes the Builders in the Environment’s BUILDERS dictionary, we must update the Environment’s attributes.

```python
__abc_impl = <_abc_data object>
```

clear () → None. Remove all items from D.

copy ()

classmethod fromkeys (iterable, value=None)

get (k [, d]) → D[k] if k in D, else d. d defaults to None.

items () → a set-like object providing a view on D’s items

keys () → a set-like object providing a view on D’s keys

pop (k [, d]) → v, remove specified key and return the corresponding value. If key is not found, d is returned if given, otherwise KeyError is raised.

popitem () → (k, v), remove and return some (key, value) pair as a 2-tuple; but raise KeyError if D is empty.

setdefault (k [, d]) → D.get(k,d), also set D[k]=d if k not in D

update ([], E, **F) → None. Update D from mapping/iterable E and F. If E present and has a .keys() method, does: for k in E: D[k] = E[k] If E present and lacks .keys() method, does: for (k, v) in E: D[k] = v In either case, this is followed by: for k, v in F.items(): D[k] = v

values () → an object providing a view on D’s values

class SCons.Environment.BuilderWrapper (obj, method, name=None)

Bases: SCons.Util.MethodWrapper

A MethodWrapper subclass that that associates an environment with a Builder. This mainly exists to wrap the __call__() function so that all calls to Builders can have their argument lists massaged in the same way (treat a lone argument as the source, treat two arguments as target then source, make sure both target and source are lists) without having to have cut-and-paste code to do it. As a bit of obsessive backwards compatibility, we also intercept attempts to get or set the “env” or “builder” attributes, which were the names we used before we put the common functionality into the MethodWrapper base class. We’ll keep this around for a while in case people shipped Tool modules that reached into the wrapper (like the Tool/qt.py module does, or did). There shouldn’t be a lot attribute fetching or setting on these, so a little extra work shouldn’t hurt.

clone (new_object)

Returns an object that re-binds the underlying “method” to the specified new object.

SCons.Environment.NoSubstitutionProxy (subject)

An entry point for returning a proxy subclass instance that overrides the subst*() methods so they don’t actually perform construction variable substitution. This is specifically intended to be the shim layer in between global function calls (which don’t want construction variable substitution) and the DefaultEnvironment() (which would substitute variables if left to its own devices). We have to wrap this in a function that allows us to delay definition of the class until it’s necessary, so that when it subclasses Environment it will pick up whatever Environment subclass the wrapper interface might have assigned to SCons.Environment.Environment.

class SCons.Environment.OverrideEnvironment (subject, overrides=None)

Bases: SCons.Environment.Base

A proxy that overrides variables in a wrapped construction environment by returning values from an overrides dictionary in preference to values from the underlying subject environment.
This is a lightweight (I hope) proxy that passes through most use of attributes to the underlying Environment.Base class, but has just enough additional methods defined to act like a real construction environment with overridden values. It can wrap either a Base construction environment, or another OverrideEnvironment, which can in turn nest arbitrary OverrideEnvironments...

Note that we do not call the underlying base class (SubstitutionEnvironment) initialization, because we get most of those from proxying the attributes of the subject construction environment. But because we subclass SubstitutionEnvironment, this class also has inherited arg2nodes() and subst*() methods; those methods can’t be proxied because they need this object’s methods to fetch the values from the overrides dictionary.

Action (*args, **kw)

AddMethod (function, name=None)
   Adds the specified function as a method of this construction environment with the specified name. If the name is omitted, the default name is the name of the function itself.

AddPostAction (files, action)

AddPreAction (files, action)

Alias (target, source=[], action=None, **kw)

AlwaysBuild (*targets)

Append (**kw)
   Append values to construction variables in an Environment.
   The variable is created if it is not already present.

AppendENVPATH (name, newpath, envname='ENV', sep=':', delete_existing=0)
   Append path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any particular path once, and will normpath and normcase all paths to help assure this. This can also handle the case where the env variable is a list instead of a string.
   If delete_existing is 0, a newpath which is already in the path will not be moved to the end (it will be left where it is).

AppendUnique (delete_existing=0, **kw)
   Append values to existing construction variables in an Environment, if they’re not already there. If delete_existing is 1, removes existing values first, so values move to end.

Builder (**kw)

CacheDir (path, custom_class=None)

Clean (targets, files)

Clone (tools=[], toolpath=None, parse_flags=None, **kw)
   Return a copy of a construction Environment.
   The copy is like a Python “deep copy”–that is, independent copies are made recursively of each objects–except that a reference is copied when an object is not deep-copyable (like a function). There are no references to any mutable objects in the original Environment.

Command (target, source, action, **kw)
   Builds the supplied target files from the supplied source files using the supplied action. Action may be any type that the Builder constructor will accept for an action.

Configure (*args, **kw)

Decider (function)

Depends (target, dependency)
   Explicitly specify that ‘target’s depend on ‘dependency’.

155
Detect (progs)
Return the first available program from one or more possibilities.

Parameters:  progs (str or list) – one or more command names to check for

Dictionary (*args)
Return construction variables from an environment.

Parameters:  *args (optional) – variable names to look up

Returns:  If args omitted, the dictionary of all construction variables. If one arg, the corresponding value is returned. If more than one arg, a list of values is returned.

 Raises:  KeyError – if any of args is not in the construction environment.

Dir (name, *args, **kw)

Dump (key=None, format='pretty')
Return construction variables serialized to a string.

Parameters:
  • key (optional) – if None, format the whole dict of variables. Else format the value of key (Default value = None)
  • format (str, optional) – specify the format to serialize to. “pretty” generates a pretty-printed string, “json” a JSON-formatted string. (Default value = “pretty”)

Entry (name, *args, **kw)

Environment (**kw)

Execute (action, *args, **kw)
Directly execute an action through an Environment

File (name, *args, **kw)

FindFile (file, dirs)

FindInstalledFiles ()
returns the list of all targets of the Install and InstallAs Builder.

FindIxes (paths, prefix, suffix)
Search a list of paths for something that matches the prefix and suffix.

Parameters:
  • paths – the list of paths or nodes.
  • prefix – construction variable for the prefix.
  • suffix – construction variable for the suffix.

Returns:  the matched path or None

FindSourceFiles (node='.')
returns a list of all source files.

Flatten (sequence)

GetBuildPath (files)

Glob (pattern, ondisk=True, source=False, strings=False, exclude=None)

Ignore (target, dependency)
Ignore a dependency.

Literal (string)
Local (*targets)

MergeFlags (args, unique=True)
Merge flags into construction variables.
Merges the flags from args into this construction environment. If args is not a dict, it is first converted to a
dictionary with flags distributed into appropriate construction variables. See ParseFlags().

Parameters:
- args – flags to merge
- unique – merge flags rather than appending (default: True)

NoCache (*targets)
Tags a target so that it will not be cached

NoClean (*targets)
Tags a target so that it will not be cleaned by -c

Override (overrides)
Produce a modified environment whose variables are overridden by the overrides dictionaries. “overrides” is a
dictionary that will override the variables of this environment.
This function is much more efficient than Clone() or creating a new Environment because it doesn’t copy the
construction environment dictionary, it just wraps the underlying construction environment, and doesn’t even
create a wrapper object if there are no overrides.

ParseConfig (command, function=None, unique=True)
Use the specified function to parse the output of the command in order to modify the current environment. The
‘command’ can be a string or a list of strings representing a command and its arguments. ‘Function’ is an
optional argument that takes the environment, the output of the command, and the unique flag. If no function is
specified, MergeFlags, which treats the output as the result of a typical ‘X-config’ command (i.e. gtk-config), will
merge the output into the appropriate variables.

ParseDepends (filename, must_exist=None, only_one=False)
Parse a mkdep-style file for explicit dependencies. This is completely abusable, and should be unnecessary in
the “normal” case of proper SCons configuration, but it may help make the transition from a Make hierarchy
easier for some people to swallow. It can also be genuinely useful when using a tool that can write a .d file, but
for which writing a scanner would be too complicated.

ParseFlags (*flags)
Return a dict of parsed flags.
Parse flags and return a dict with the flags distributed into the appropriate construction variable names. The
flags are treated as a typical set of command-line flags for a GNU-like toolchain, such as might have been
generated by one of the {foo}-config scripts, and used to populate the entries based on knowledge embedded in
this method - the choices are not expected to be portable to other toolchains.
If one of the flags strings begins with a bang (exclamation mark), it is assumed to be a command and the rest
of the string is executed; the result of that evaluation is then added to the dict.

Platform (platform)

Precious (*targets)

Prepend (**kw)
Prepend values to construction variables in an Environment.
The variable is created if it is not already present.

PrependENVPath (name, newpath, envname='ENV', sep=':', delete_existing=1)
Prepend path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any
particular path once, and will normpath and normcase all paths to help assure this. This can also handle the
case where the env variable is a list instead of a string.
If delete_existing is 0, a newpath which is already in the path will not be moved to the front (it will be left where it
is).
PrependUnique (delete_existing=0, **kw)
Prepend values to existing construction variables in an Environment, if they’re not already there. If
delete_existing is 1, removes existing values first, so values move to front.

Pseudo (*targets)

PyPackageDir (modulename)

RemoveMethod (function)
Removes the specified function’s MethodWrapper from the added_methods list, so we don’t re-bind it when
making a clone.

Replace (**kw)
Replace existing construction variables in an Environment with new construction variables and/or values.

ReplaceIxes (path, old_prefix, old_suffix, new_prefix, new_suffix)
Replace old_prefix with new_prefix and old_suffix with new_suffix.

Repository (*dirs, **kw)

Requires (target, prerequisite)
Specify that ‘prerequisite’ must be built before ‘target’, (but ‘target’ does not actually depend on ‘prerequisite’
and need not be rebuilt if it changes).

SConsignFile (name='.sconsign', dbm_module=None)

Scanner (*args, **kw)

SetDefault (**kw)

SideEffect (side_effect, target)
Tell scons that side_effects are built as side effects of building targets.

Split (arg)
This function converts a string or list into a list of strings or Nodes. This makes things easier for users by
allowing files to be specified as a white-space separated list to be split.

The input rules are:

- A single string containing names separated by spaces. These will be split apart at the spaces.
- A single Node instance
- A list containing either strings or Node instances. Any strings in the list are not split at spaces.
In all cases, the function returns a list of Nodes and strings.

Tool (tool, toolpath=None, **kwargs) → SCons.Tool.Tool

Value (value, built_value=None, name=None)

VariantDir (variant_dir, src_dir, duplicate=1)

WhereIs (prog, path=None, pathext=None, reject=None)
Find prog in the path.

_canonicalize (path)
Allow Dirs and strings beginning with # for top-relative. 
Note this uses the current env’s fs (in self).
SCons Project API Documentation

.changed_build (dependency, target, prev_ni, repo_node=None)
.changed_content (dependency, target, prev_ni, repo_node=None)
.changed_source (dependency, target, prev_ni, repo_node=None)
.changed_timestamp_match (dependency, target, prev_ni, repo_node=None)
.changed_timestamp_newer (dependency, target, prev_ni, repo_node=None)
.changed_timestamp_then_content (dependency, target, prev_ni, repo_node=None)

.find_toolpath_dir (tp)

.gsm ()

_init_special ()
Initial the dispatch tables for special handling of special construction variables.

.update (other)
Private method to update an environment’s consvar dict directly.
Bypasses the normal checks that occur when users try to set items.

.update_onlynew (other)
Private method to add new items to an environment’s consvar dict.
Only adds items from other whose keys do not already appear in the existing dict; values from other are not used for replacement. Bypasses the normal checks that occur when users try to set items.

arg2nodes (args, node_factory=<class 'SCons.Environment._Null'>, lookup_list=<class 'SCons.Environment._Null'>,**kw)

backtick (command)

get (key, default=None)
Emulates the get() method of dictionaries.

get_CacheDir ()

get_builder (name)
Fetch the builder with the specified name from the environment.

get_factory (factory, default='File')
Return a factory function for creating Nodes for this construction environment.

get_scanner (skey)
Find the appropriate scanner given a key (usually a file suffix).

get_src_sig_type ()

get_tgt_sig_type ()
gvars ()

items ()
Emulates the items() method of dictionaries.

keys ()
Emulates the keys() method of dictionaries.
lvars ()
**scanner_map_delete** (kw=None)
Delete the cached scanner map (if we need to).

**setdefault** (key, default=None)
Emulates the setdefault() method of dictionaries.

**subst** (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

**subst_kw** (kw, raw=0, target=None, source=None)

**subst_list** (string, raw=0, target=None, source=None, conv=None, executor=None)
Calls through to SCons.Subst.scons_subst_list(). See the documentation for that function.

**subst_path** (path, target=None, source=None)
Substitute a path list, turning EntryProxies into Nodes and leaving Nodes (and other objects) as-is.

**subst_target_source** (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

**validate_CacheDir_class** (custom_class=None)
Validate the passed custom CacheDir class, or if no args are passed, validate the custom CacheDir class from the environment.

**values** ()
Emulates the values() method of dictionaries.

**class** SCons.Environment.SubstitutionEnvironment (**kw)
Bases: **object**
Base class for different flavors of construction environments.
This class contains a minimal set of methods that handle construction variable expansion and conversion of strings to Nodes, which may or may not be actually useful as a stand-alone class. Which methods ended up in this class is pretty arbitrary right now. They’re basically the ones which we’ve empirically determined are common to the different construction environment subclasses, and most of the others that use or touch the underlying dictionary of construction variables.
Eventually, this class should contain all the methods that we determine are necessary for a “minimal” interface to the build engine. A full “native Python” SCons environment has gotten pretty heavyweight with all of the methods and Tools and construction variables we’ve jammed in there, so it would be nice to have a lighter weight alternative for interfaces that don’t need all of the bells and whistles. (At some point, we’ll also probably rename this class “Base,” since that more reflects what we want this class to become, but because we’ve released comments that tell people to subclass Environment.Base to create their own flavors of construction environment, we’ll save that for a future refactoring when this class actually becomes useful.)

**AddMethod** (function, name=None)
Adds the specified function as a method of this construction environment with the specified name. If the name is omitted, the default name is the name of the function itself.

**MergeFlags** (args, unique=True)
Merge flags into construction variables.
Merges the flags from args into this construction environent. If args is not a dict, it is first converted to a dictionary with flags distributed into appropriate construction variables. See **ParseFlags**().

Parameters:
- **args** – flags to merge
- **unique** – merge flags rather than appending (default: True)
Override (overrides)
Produce a modified environment whose variables are overridden by the overrides dictionaries. "overrides" is a
dictionary that will override the variables of this environment.
This function is much more efficient than Clone() or creating a new Environment because it doesn’t copy the
construction environment dictionary, it just wraps the underlying construction environment, and doesn’t even
create a wrapper object if there are no overrides.

ParseFlags (flags)
Return a dict of parsed flags.
Parse flags and return a dict with the flags distributed into the appropriate construction variable names. The
flags are treated as a typical set of command-line flags for a GNU-like toolchain, such as might have been
generated by one of the {foo}-config scripts, and used to populate the entries based on knowledge embedded in
this method - the choices are not expected to be portable to other toolchains.
If one of the flags strings begins with a bang (exclamation mark), it is assumed to be a command and the rest
of the string is executed; the result of that evaluation is then added to the dict.

RemoveMethod (function)
Removes the specified function’s MethodWrapper from the added_methods list, so we don’t re-bind it when
making a clone.

_init_special ()
Initial the dispatch tables for special handling of special construction variables.

arg2nodes (args, node_factory=<class 'SCons.Environment._Null'>, lookup_list=<class 'SCons.Environment._Null'>, **kw)

backtick (command)

get (key, default=None)
Emulates the get() method of dictionaries.

gvars ()

items ()
Emulates the items() method of dictionaries.

keys ()
Emulates the keys() method of dictionaries.

lvars ()

setdefault (key, default=None)
Emulates the setdefault() method of dictionaries.

subst (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the
expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial
underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The
construction variable names may be surrounded by curly braces to separate the name from trailing characters.

subst_kw (kw, raw=0, target=None, source=None)

subst_list (string, raw=0, target=None, source=None, conv=None, executor=None)
Calls through to SCons.Subst.scons_subst_list(). See the documentation for that function.

subst_path (path, target=None, source=None)
Substitute a path list, turning EntryProxies into Nodes and leaving Nodes (and other objects) as-is.

subst_target_source (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the
expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial
underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

```python
values()
```

Emulates the values() method of dictionaries.

```python
class SCons.Environment._Null
    Bases: object
SCons.Environment._del_SCANNERS(env, key)
SCons.Environment._delete_duplicates(l, keep_last)
    Delete duplicates from a sequence, keeping the first or last.
SCons.Environment._null
    alias of SCons.Environment._Null
SCons.Environment._set_BUILDERS(env, key, value)
SCons.Environment._set_SCANNERS(env, key, value)
SCons.Environment._set_future_reserved(env, key, value)
SCons.Environment._set_reserved(env, key, value)
SCons.Environment.alias_builder(env, target, source)
SCons.Environment.apply_tools(env, tools, toolpath)
SCons.Environment.copy_non_reserved_keywords(dict)
SCons.Environment.default_copy_from_cache(env, src, dst)
SCons.Environment.default_copy_to_cache(env, src, dst)
SCons.Environment.default_decide_source(dependency, target, prev_li, repo_node=None)
SCons.Environment.default_decide_target(dependency, target, prev_li, repo_node=None)
SCons.Environment.is_valid_construction_var(varstr)
    Return if the specified string is a legitimate construction variable.
```

### SCons.Errors module

SCons exception classes.

Used to handle internal and user errors in SCons.

```python
exception SCons.Errors.BuildError (node=None, errstr='Unknown error', status=2, exitstatus=2, filename=None, executor=None, action=None, command=None, exc_info=(None, None, None))
    Bases: Exception
    SCons Errors that can occur while building.
```

**Information about the cause of the build error**

```python
errstr
    a description of the error message
status
    the return code of the action that caused the build error. Must be set to a non-zero value even if the build error is not due to an action returning a non-zero returned code.
exitstatus
    SCons exit status due to this build error. Must be nonzero unless due to an explicit Exit() call. Not always the same as status, since actions return a status code that should be respected, but SCons typically exits with 2 irrespective of the return value of the failed action.
filename
```
The name of the file or directory that caused the build error. Set to None if no files are associated with this error. This might be different from the target being built. For example, failure to create the directory in which the target file will appear. It can be None if the error is not due to a particular filename.

exc_info
Info about exception that caused the build error. Set to (None, None, None) if this build error is not due to an exception.

Information about the what caused the build error

node
the error occurred while building this target node(s)

executor
the executor that caused the build to fail (might be None if the build failures is not due to the executor failing)

action
the action that caused the build to fail (might be None if the build failures is not due to the an action failure)

command
the command line for the action that caused the build to fail (might be None if the build failures is not due to the an action failure)

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Errors.ExplicitExit (node=None, status=None, *args)
Bases: Exception

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Errors.InternalError
Bases: Exception

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Errors.MSVCError
Bases: OSError

args

characters_written

errno
POSIX exception code

filename
exception filename

filename2
second exception filename

strerror
Exception.

### SCons.EnvironmentError

**Bases:** Exception

```python
with_traceback()  
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
```

### SCons.StopError

**Bases:** Exception

```python
with_traceback()  
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
```

### SCons.UserError

**Bases:** Exception

```python
with_traceback()  
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
```

---

### SCons.Executor module

Execute actions with specific lists of target and source Nodes.

**SCons.Executor.AddBatchExecutor**

```python
class SCons.Executor.AddBatchExecutor (key, executor)
Bases: object
Remembers exact association between targets and sources of executor.
```

**SCons.Executor.Batch**

```python
class SCons.Executor.Batch (targets=[], sources=[])  
Bases: object
Remembers exact association between targets and sources of executor.
```

**SCons.Executor.Executor**

```python
class SCons.Executor.Executor (action, env=None, overridelist=[], targets=[], sources=[], builder_kw={})  
Bases: object
A class for controlling instances of executing an action.  
This largely exists to hold a single association of an action, environment, list of environment override dictionaries, targets and sources for later processing as needed.
```

- `_changed_sources_list`
- `_changed_targets_list`
- `_do_execute`
_execute_str

_get_changed_sources (*args, **kw)

_get_changed_targets (*args, **kw)

_get_changes ()

_get_source (*args, **kw)

_get_sources (*args, **kw)

_get_target (*args, **kw)

_get_targets (*args, **kw)

_get_unchanged_sources (*args, **kw)

_get_unchanged_targets (*args, **kw)

_get_unignored_sources_key (node, ignore=())

_mem

_unchanged_sources_list

_unchanged_targets_list

action_list

add_batch (targets, sources)

Add pair of associated target and source to this Executor’s list. This is necessary for “batch” Builders that can be called repeatedly to build up a list of matching target and source files that will be used in order to update multiple target files at once from multiple corresponding source files, for tools like MSVC that support it.

add_post_action (action)

add_pre_action (action)

add_sources (sources)

Add source files to this Executor’s list. This is necessary for “multi” Builders that can be called repeatedly to build up a source file list for a given target.

batches

builder_kw

cleanup ()

env

get_action_list ()

get_action_side_effects ()

Returns all side effects for all batches of this Executor used by the underlying Action.

get_action_targets ()

get_all_children ()

Returns all unique children (dependencies) for all batches of this Executor.
The Taskmaster can recognize when it’s already evaluated a Node, so we don’t have to make this list unique for its intended canonical use case, but we expect there to be a lot of redundancy (long lists of batched .cc files including the same .h files over and over), so removing the duplicates once up front should save the Taskmaster a lot of work.

get_all_prerequisites()
Returns all unique (order-only) prerequisites for all batches of this Executor.

get_all_sources()
Returns all sources for all batches of this Executor.

get_all_targets()
Returns all targets for all batches of this Executor.

get_build_env()
Fetch or create the appropriate build Environment for this Executor.

get_build_scanner_path (scanner)
Fetch the scanner path for this executor’s targets and sources.

get_contents()
Fetch the signature contents. This is the main reason this class exists, so we can compute this once and cache it regardless of how many target or source Nodes there are.
Returns bytes

get_implicit_deps()
Return the executor’s implicit dependencies, i.e. the nodes of the commands to be executed.

get_kw (kw={})
get_lvars()
get_sources()

get_timestamp()
Fetch a time stamp for this Executor. We don’t have one, of course (only files do), but this is the interface used by the timestamp module.

get_unignored_sources (node, ignore={})
lvars
nullify()
overridelist
post_actions
pre_actions
prepare()
Preparatory checks for whether this Executor can go ahead and (try to) build its targets.

scan (scanner, node_list)
Scan a list of this Executor’s files (targets or sources) for implicit dependencies and update all of the targets with them. This essentially short-circuits an N*M scan of the sources for each individual target, which is a hell of a lot more efficient.

scan_sources (scanner)
scan_targets (scanner)
SCons Project API Documentation

```python
set_action_list (action)
SCons.Executor.GetBatchExecutor (key)

class SCons.Executor_Null (*args, **kw)
Bases: object
A null Executor, with a null build Environment, that does nothing when the rest of the methods call it.
This might be able to disappear when we refactor things to disassociate Builders from Nodes entirely, so we’re not
going to worry about unit tests for this—at least for now.

_changed_sources_list
_changed_targets_list
_do_execute
_execute_str
_memo
_morph ()
   Morph this Null executor to a real Executor object.

_unchanged_sources_list
_unchanged_targets_list
action_list
add_post_action (action)
add_pre_action (action)
batches
builder_kw
cleanup ()

get_all_sources ()
get_all_targets ()
get_build_env ()
get_build_scanner_path ()
get_contents ()
```
get_unignored_sources(*args, **kw)

lvars

overridelist

post_actions

pre_actions

prepare()

set_action_list(action)

class SCons.Executor.NullEnvironment(*args, **kwargs)
    Bases: SCons.Util.Null

SCons = <module 'SCons' from '/Users/bdbaddog/devel/scons/git/as_scons/SCons/__init__.py'>

_CacheDir = <SCons.CacheDir.CacheDir object>

_CacheDir_path = None

get_CacheDir()

class SCons.Executor.TSList(func)
    Bases: collections.UserList

A class that implements $TARGETS or $SOURCES expansions by wrapping an executor Method. This class is
used in the Executor.lvars() to delay creation of NodeList objects until they’re needed.
Note that we subclass collections.UserList purely so that the is_Sequence() function will identify an object of this
class as a list during variable expansion. We’re not really using any collections.UserList methods in practice.

__abc_impl = <_abc_data object>

append(item)
    S.append(value) – append value to the end of the sequence

clear() → None – remove all items from S

copy()

count(value) → integer – return number of occurrences of value

extend(other)
    S.extend(iterable) – extend sequence by appending elements from the iterable

index(value[, start[, stop]]) → integer – return first index of value.
    Raises ValueError if the value is not present.
    Supporting start and stop arguments is optional, but recommended.

insert(i, item)
    S.insert(index, value) – insert value before index

pop([i, index]) → item – remove and return item at index (default last).
    Raise IndexError if list is empty or index is out of range.

remove(item)
    S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse()
    S.reverse() – reverse IN PLACE
sort (*args, **kwds)

class SCons.Executor.TSObject (func)
    Bases: object
    A class that implements $TARGET or $SOURCE expansions by wrapping an Executor method.

SCons.Executor.execute_action_list (obj, target, kw)
    Actually execute the action list.

SCons.Executor.execute_actions_str (obj)

SCons.Executor.execute_nothing (obj, target, kw)

SCons.Executor.execute_null_str (obj)

SCons.Executor.get_NullEnvironment ()
    Use singleton pattern for Null Environments.

SCons.Executor.rfile (node)
    A function to return the results of a Node’s rfile() method, if it exists, and the Node itself otherwise (if it’s a Value Node, e.g.).

---

**SCons.Job module**

Serial and Parallel classes to execute build tasks.

The Jobs class provides a higher level interface to start, stop, and wait on jobs.

class SCons.Job.InterruptState
    Bases: object

    set ()

class SCons.Job.Jobs (num, taskmaster)
    Bases: object
    An instance of this class initializes N jobs, and provides methods for starting, stopping, and waiting on all N jobs.

    _reset_sig_handler ()
        Restore the signal handlers to their previous state (before the call to _setup_sig_handler()).

    _setup_sig_handler ()
        Setup an interrupt handler so that SCons can shutdown cleanly in various conditions:

        a. SIGINT: Keyboard interrupt
        b. SIGTERM: kill or system shutdown
        c. SIGHUP: Controlling shell exiting

        We handle all of these cases by stopping the taskmaster. It turns out that it’s very difficult to stop the build process by throwing asynchronously an exception such as KeyboardInterrupt. For example, the python Condition variables (threading.Condition) and queues do not seem to be asynchronous-exception-safe. It would require adding a whole bunch of try/finally block and except KeyboardInterrupt all over the place.

        Note also that we have to be careful to handle the case when SCons forks before executing another process. In that case, we want the child to exit immediately.

    run (postfunc=<function Jobs.<lambda>>)
        Run the jobs.
        postfunc() will be invoked after the jobs has run. It will be invoked even if the jobs are interrupted by a keyboard interrupt (well, in fact by a signal such as either SIGINT, SIGTERM or SIGHUP). The execution of postfunc() is protected against keyboard interrupts and is guaranteed to run to completion.

    were_interrupted ()
        Returns whether the jobs were interrupted by a signal.

class SCons.Job.Parallel (taskmaster, num, stack_size)
This class is used to execute tasks in parallel, and is somewhat less efficient than Serial, but is appropriate for parallel builds.
This class is thread safe.

start()
Start the job. This will begin pulling tasks from the taskmaster and executing them, and return when there are no more tasks. If a task fails to execute (i.e. execute() raises an exception), then the job will stop.

class SCons.Job.Serial (taskmaster)
Bases: object
This class is used to execute tasks in series, and is more efficient than Parallel, but is only appropriate for non-parallel builds. Only one instance of this class should be in existence at a time.
This class is not thread safe.

start()
Start the job. This will begin pulling tasks from the taskmaster and executing them, and return when there are no more tasks. If a task fails to execute (i.e. execute() raises an exception), then the job will stop.

class SCons.Job.ThreadPool (num, stack_size, interrupted)
Bases: object
This class is responsible for spawning and managing worker threads.

cleanup()
Shuts down the thread pool, giving each worker thread a chance to shut down gracefully.

get()
Remove and return a result tuple from the results queue.

preparation_failed(task)

put(task)
Put task into request queue.

class SCons.Job.Worker (requestQueue, resultsQueue, interrupted)
Bases: threading.Thread
A worker thread waits on a task to be posted to its request queue, dequeues the task, executes it, and posts a tuple including the task and a boolean indicating whether the task executed successfully.

_bootstrap()

_bootstrap_inner()

_delete()
Remove current thread from the dict of currently running threads.

_exc_info()
exc_info() -> (type, value, traceback)
Return information about the most recent exception caught by an except clause in the current stack frame or in an older stack frame.

_initialized = False

_reset_internal_locks (is_alive)

_set_ident()

_set_tstate_lock()
Set a lock object which will be released by the interpreter when the underlying thread state (see pystate.h) gets deleted.
property daemonic

A boolean value indicating whether this thread is a daemon thread.
This must be set before start() is called, otherwise RuntimeError is raised. Its initial value is inherited from the
creating thread; the main thread is not a daemon thread and therefore all threads created in the main thread
default to daemonic = False.
The entire Python program exits when only daemon threads are left.

getName ()

property ident

Thread identifier of this thread or None if it has not been started.
This is a nonzero integer. See the get_ident() function. Thread identifiers may be recycled when a thread exits
and another thread is created. The identifier is available even after the thread has exited.

isAlive ()

Return whether the thread is alive.
This method is deprecated, use isAlive() instead.

isDaemon ()

isAlive ()

Return whether the thread is alive.
This method returns True just before the run() method starts until just after the run() method terminates. The
module function enumerate() returns a list of all alive threads.

join (timeout=None)

Wait until the thread terminates.
This blocks the calling thread until the thread whose join() method is called terminates — either normally or
through an unhandled exception or until the optional timeout occurs.
When the timeout argument is present and not None, it should be a floating point number specifying a timeout
for the operation in seconds (or fractions thereof). As join() always returns None, you must call isAlive() after
join() to decide whether a timeout happened — if the thread is still alive, the join() call timed out.
When the timeout argument is not present or None, the operation will block until the thread terminates.
A thread can be join()ed many times.
join() raises a RuntimeError if an attempt is made to join the current thread as that would cause a deadlock. It is
also an error to join() a thread before it has been started and attempts to do so raises the same exception.

property name

A string used for identification purposes only.
It has no semantics. Multiple threads may be given the same name. The initial name is set by the constructor.

run ()

Method representing the thread’s activity.
You may override this method in a subclass. The standard run() method invokes the callable object passed to
the object’s constructor as the target argument, if any, with sequential and keyword arguments taken from the
args and kwargs arguments, respectively.

setDaemon (daemonic)

setName (name)

start ()

Start the thread’s activity.
It must be called at most once per thread object. It arranges for the object’s run() method to be invoked in a
separate thread of control.
This method will raise a RuntimeError if called more than once on the same thread object.
SCons.Memoize module

Decorator-based memoizer to count caching stats.

A decorator-based implementation to count hits and misses of the computed values that various methods cache in memory.

Use of this module assumes that wrapped methods be coded to cache their values in a consistent way. In particular, it requires that the class uses a dictionary named "_memo" to store the cached values.

Here is an example of wrapping a method that returns a computed value, with no input parameters:

```python
@SCons.Memoize.CountMethodCall
def foo(self):
    try: # Memoization
        return self._memo['foo'] # Memoization
    except KeyError: # Memoization
        pass # Memoization
    result = self.compute_foo_value() # Memoization

    self._memo['foo'] = result # Memoization

    return result # Memoization
```

Here is an example of wrapping a method that will return different values based on one or more input arguments:

```python
def _bar_key(self, argument): # Memoization
    return argument # Memoization

@SCons.Memoize.CountDictCall(_bar_key)
def bar(self, argument): # Memoization
    memo_key = argument # Memoization
    try: # Memoization
        memo_dict = self._memo['bar'] # Memoization
    except KeyError: # Memoization
        memo_dict = {} # Memoization
    self._memo['dict'] = memo_dict # Memoization
    else: # Memoization
        try: # Memoization
            return memo_dict[memo_key] # Memoization
        except KeyError: # Memoization
            pass # Memoization
        result = self.compute_bar_value(argument) # Memoization

        memo_dict[memo_key] = result # Memoization

        return result # Memoization
```

Deciding what to cache is tricky, because different configurations can have radically different performance tradeoffs, and because the tradeoffs involved are often so non-obvious. Consequently, deciding whether or not to cache a given method will likely be more of an art than a science, but should still be based on available data from this module. Here are some VERY GENERAL guidelines about deciding whether or not to cache return values from a method that's being called a lot:

- The first question to ask is, “Can we change the calling code”
  so this method isn’t called so often? Sometimes this can be done by changing the algorithm. Sometimes the caller should be memoized, not the method you’re looking at.

  The memoized function should be timed with multiple configurations to make sure it doesn’t inadvertently slow down some other configuration.
When memoizing values based on a dictionary key composed of input arguments, you don’t need to use all of the arguments if some of them don’t affect the return values.

```python
class SCons.Memoize.CountDict (cls_name, method_name, keymaker):
    Bases: SCons.Memoize.Counter
    A counter class for memoized values stored in a dictionary, with keys based on the method’s input arguments. A CountDict object is instantiated in a decorator for each of the class’s methods that memoizes its return value in a dictionary, indexed by some key that can be computed from one or more of its input arguments.

count (*args, **kw)
    Counts whether the computed key value is already present in the memoization dictionary (a hit) or not (a miss).

display ()

key ()
```

```python
SCons.Memoize.CountDictCall (keyfunc)
    Decorator for counting memoizer hits/misses while accessing dictionary values with a key-generating function. Like CountMethodCall above, it wraps the given method fn and uses a CountDict object to keep track of the caching statistics. The dict-key function keyfunc has to get passed in the decorator call and gets stored in the CountDict instance. Wrapping gets enabled by calling EnableMemoization().

SCons.Memoize.CountMethodCall (fn)
    Decorator for counting memoizer hits/misses while retrieving a simple value in a class method. It wraps the given method fn and uses a CountValue object to keep track of the caching statistics. Wrapping gets enabled by calling EnableMemoization().
```

```python
class SCons.Memoize.CountValue (cls_name, method_name):
    Bases: SCons.Memoize.Counter
    A counter class for simple, atomic memoized values. A CountValue object should be instantiated in a decorator for each of the class’s methods that memoizes its return value by simply storing the return value in its _memo dictionary.

count (*args, **kw)
    Counts whether the memoized value has already been set (a hit) or not (a miss).

display ()

key ()
```

```python
class SCons.Memoize.Counter (cls_name, method_name):
    Bases: object
    Base class for counting memoization hits and misses. We expect that the initialization in a matching decorator will fill in the correct class name and method name that represents the name of the function being counted.

display ()

key ()
```

```python
SCons.Memoize.Dump (title=None)
    Dump the hit/miss count for all the counters collected so far.
SCons.Memoize.EnableMemoization ()
```

---

**SCons.PathList module**

Handle lists of directory paths.

These are the path lists that get set as CPPPATH, LIBPATH, etc.) with as much caching of data and efficiency as we can, while still keeping the evaluation delayed so that we Do the Right Thing (almost) regardless of how the variable is specified.
SCons PathList

PathList(pathlist)
Returns the cached _PathList object for the specified pathlist, creating and caching a new object as necessary.

class SCons.PathList._PathList(pathlist)
Bases: object
An actual PathList object.

```python
subst_path(env, target, source)
Performs construction variable substitution on a pre-digested PathList for a specific target and source.
```

SCons.PathList.node_conv(obj)
This is the "string conversion" routine that we have our substitutions use to return Nodes, not strings. This relies on
the fact that an EntryProxy object has a get() method that returns the underlying Node that it wraps, which is a bit
of architectural dependence that we might need to break or modify in the future in response to additional
requirements.

SCons.SConf module

Autoconf-like configuration support.

In other words, SConf allows to run tests on the build machine to detect capabilities of system and do some things
based on result: generate config files, header files for C/C++, update variables in environment.

Tests on the build system can detect if compiler sees header files, if libraries are installed, if some command line
options are supported etc.

```python
SCons.SConf.CheckCC(context)
```

```python
SCons.SConf.CheckCHeader(context, header, include_quotes="""")
A test for a C header file.
```

```python
SCons.SConf.CheckCXX(context)
```

```python
SCons.SConf.CheckCXXHeader(context, header, include_quotes="""")
A test for a C++ header file.
```

class SCons.SConf.CheckContext(sconf)
Bases: object
Provides a context for configure tests. Defines how a test writes to the screen and log file.
A typical test is just a callable with an instance of CheckContext as first argument:

```python
def CheckCustom(context, ...):
    context.Message('Checking my weird test ... ') ret = myWeirdTestFunction(...) context.Result(ret)
```

Often, myWeirdTestFunction will be one of context.TryCompile/context.TryLink/context.TryRun. The results of
those are cached, for they are only rebuild, if the dependencies have changed.

```python
AppendLIBS(lib_name_list)
BuildProg(text, ext)
CompileProg(text, ext)
CompileSharedObject(text, ext)
Display(msg)
Log(msg)
Message(text)
    Inform about what we are doing right now, e.g. 'Checking for SOMETHING …'
PrependLIBS(lib_name_list)
Result(res)```
Inform about the result of the test. If res is not a string, displays ‘yes’ or ‘no’ depending on whether res is evaluated as true or false. The result is only displayed when self.did_show_result is not set.

RunProg (text, ext)

SetLIBS (val)

TryAction (*args, **kw)

TryBuild (*args, **kw)

TryCompile (*args, **kw)

TryLink (*args, **kw)

TryRun (*args, **kw)

SCons.SConf.CheckDeclaration (context, declaration, includes='', language=None)

SCons.SConf.CheckFunc (context, function_name, header=None, language=None)

SCons.SConf.CheckHeader (context, header, include_quotes='<>', language=None)

A test for a C or C++ header file.

SCons.SConf.CheckLib (context, library=None, symbol='main', header=None, language=None, autoadd=1)

A test for a library. See also CheckLibWithHeader. Note that library may also be None to test whether the given symbol compiles without flags.

SCons.SConf.CheckLibWithHeader (context, libs, header, language, call=None, autoadd=1)

Another (more sophisticated) test for a library. Checks, if library and header is available for language (may be ‘C’ or ‘CXX’). Call maybe be a valid expression _with_ a trailing ‘;’. As in CheckLib, we support library=None, to test if the call compiles without extra link flags.

SCons.SConf.CheckProg (context, prog_name)

Simple check if a program exists in the path. Returns the path for the application, or None if not found.

SCons.SConf.CheckSHCC (context)

SCons.SConf.CheckSHCXX (context)

SCons.SConf.CheckType (context, type_name, includes='', language=None)

SCons.SConf.CheckTypeSize (context, type_name, includes='', language=None, expect=None)

exception SCons.SConf.ConfigureCacheError (target)

Bases: SCons.SConf.SConfError

Raised when a use explicitely requested the cache feature, but the test is run the first time.

  args

  with_traceback ()

  Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.SConf.ConfigureDryRunError (target)

Bases: SCons.SConf.SConfError

Raised when a file or directory needs to be updated during a Configure process, but the user requested a dry-run

  args

  with_traceback ()

  Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.SConf.CreateConfigHBuilder (env)

Called if necessary just before the building targets phase begins.

SCons.SConf.NeedConfigHBuilder ()
This is simply a class to represent a configure context. After creating a SConf object, you can call any tests. After finished with your tests, be sure to call the Finish() method, which returns the modified environment. Some words about caching: In most cases, it is not necessary to cache Test results explicitly. Instead, we use the scons dependency checking mechanism. For example, if one wants to compile a test program (SConf.TryLink), the compiler is only called, if the program dependencies have changed. However, if the program could not be compiled in a former SConf run, we need to explicitly cache this error.

```
AddTest (test_name, test_instance)
    Adds test_class to this SConf instance. It can be called with self.test_name(...)

AddTests (tests)
    Adds all the tests given in the tests dictionary to this SConf instance

BuildNodes (nodes)
    Tries to build the given nodes immediately. Returns 1 on success, 0 on error.

Define (name, value=None, comment=None)
    Define a pre processor symbol name, with the optional given value in the current config header.
    If value is None (default), then #define name is written. If value is not none, then #define name value is written.
    comment is a string which will be put as a C comment in the header, to explain the meaning of the value
    (appropriate C comments will be added automatically).

Finish ()
    Call this method after finished with your tests: env = sconf.Finish()
```

class TestWrapper (test, sconf)
    Bases: object
    A wrapper around Tests (to ensure sanity)

```
TryAction (action, text=None, extension='')
    Tries to execute the given action with optional source file contents <text> and optional source file extension
    <extension>, Returns the status (0 : failed, 1 : ok) and the contents of the output file.

TryBuild (builder, text=None, extension='')
    Low level TryBuild implementation. Normally you don’t need to call that - you can use TryCompile / TryLink /
    TryRun instead

TryCompile (text, extension)
    Compiles the program given in text to an env.Object, using extension as file extension (e.g. ‘.c’). Returns 1, if
    compilation was successful, 0 otherwise. The target is saved in self.lastTarget (for further processing).

TryLink (text, extension)
    Compiles the program given in text to an executable env.Program, using extension as file extension (e.g. ‘.c’).
    Returns 1, if compilation was successful, 0 otherwise. The target is saved in self.lastTarget (for further
    processing).

TryRun (text, extension)
    Compiles and runs the program given in text, using extension as file extension (e.g. ‘.c’). Returns (1, outputStr)
    on success, (0, '') otherwise. The target (a file containing the program’s stdout) is saved in self.lastTarget (for
    further processing).
```

_privateDir (node)

_privateshutdown ()
    Private method. Reset to non-piped spawn
_startup()
Private method. Set up logstream, and set the environment variables necessary for a piped build

pspawn_wrapper (sh, escape, cmd, args, env)
Wrapper function for handling piped spawns.
This looks to the calling interface (in Action.py) like a “normal” spawn, but associates the call with the PSPAWN variable from the construction environment and with the streams to which we want the output logged. This gets slid into the construction environment as the SPAWN variable so Action.py doesn’t have to know or care whether it’s spawning a piped command or not.

class SCons.SConf.SConfBuildInfo
Bases: SCons.Node.FS.FileBuildInfo
Special build info for targets of configure tests. Additional members are result (did the builder succeed last time?) and string, which contains messages of the original build phase.

bact
bactsig
bdepends
bdependsigs
bimplicit
bimplicit sigs
bsources
bsourcesigs

convert_from_sconsign (dir, name)
Converts a newly-read FileBuildInfo object for in-SCons use
For normal up-to-date checking, we don’t have any conversion to perform—but we’re leaving this method here to make that clear.

convert_to_sconsign ()
Converts this FileBuildInfo object for writing to a .sconsign file
This replaces each Node in our various dependency lists with its usual string representation: relative to the top-level SConstruct directory, or an absolute path if it’s outside.

current_version_id = 2

dependency_map

format (names=0)

merge (other)
Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a ‘__dict__’ slot is added, it should be updated instead of replaced.

prepare_dependencies ()
Prepares a FileBuildInfo object for explaining what changed
The bsources, bdepends and bimplicit lists have all been stored on disk as paths relative to the top-level SConstruct directory. Convert the strings to actual Nodes (for use by the –debug=explain code and –implicit-cache).

result

set_build_result (result, string)
class SCons.SConf.SConfBuildTask (tm, targets, top, node)

Bases: SCons.Taskmaster.AlwaysTask

This is almost the same as SCons.Script.BuildTask. Handles SConfErrors correctly and knows about the current cache_mode.

__abc_impl = <_abc_data object>

__exception_raise ()

Raises a pending exception that was recorded while getting a Task ready for execution.

__no_exception_to_raise ()

collect_node_states ()

display (message)

Hook to allow the calling interface to display a message.
This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

display_cached_string (bi)

Logs the original builder messages, given the SConfBuildInfo instance bi.

exc_clear ()

Clears any recorded exception.
This also changes the "exception_raise" attribute to point to the appropriate do-nothing method.

exc_info ()

Returns info about a recorded exception.

exception_set (exception=None)

Records an exception to be raised at the appropriate time.
This also changes the "exception_raise" attribute to point to the method that will, in fact

execute ()

Called to execute the task.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in prepare(), executed() or failed().

executed ()

Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_with_callbacks ()

Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_without_callbacks ()

Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the Node’s callback methods.
fail_continue()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons
-c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t.
their dependencies) can use this as follows:

class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no
build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a
common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary
directories before the Action is actually called to build the targets.

trace_message(method, node, description='node')

exception SCons.SConf.SConfError (msg)
Bases: SCons.Errors.UserError

args

with_traceback()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
SCons Project API Documentation

**exception** SCons.SConf.SConfWarning

- Bases: SCons.Warnings.SConsWarning

**with_traceback ()**

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.SConf.SetBuildType (buildtype)

SCons.SConf.SetCacheMode (mode)

- Set the Configure cache mode. mode must be one of “auto”, “force”, or “cache”.

SCons.SConf.SetProgressDisplay (display)

- Set the progress display to use (called from SCons.Script)

**class** SCons.SConfStreamer (orig)

- Bases: object

‘Sniffer’ for a file-like writable object. Similar to the unix tool tee.

**flush ()**

- Return everything written to orig since the Streamer was created.

**write (str)**

**writelines (lines)**

SCons.SConf._createConfigH (target, source, env)

SCons.SConf._createSource (target, source, env)

SCons.SConf._set_conftest_node (node)

SCons.SConf._stringConfigH (target, source, env)

SCons.SConf._stringSource (target, source, env)

SCons.SConf.createIncludesFromHeaders (headers, leaveLast, include_quotes=""")

**SCons.SConsign module**

Operations on signature database files (.sconsign).

**class** SCons.SConsign.Base

- Bases: object

This is the controlling class for the signatures for the collection of entries associated with a specific directory. The actual directory association will be maintained by a subclass that is specific to the underlying storage method. This class provides a common set of methods for fetching and storing the individual bits of information that make up signature entry.

**do_not_set_entry (filename, obj)**

**do_not_store_info (filename, node)**

**get_entry (filename)**

- Fetch the specified entry attribute.

**merge ()**

**set_entry (filename, obj)**

- Set the entry.

**store_info (filename, node)**
class SCons.SConsign.DB (dir)
    Bases: SCons.SConsign.Base
    A Base subclass that reads and writes signature information from a global .sconsign.db* file—the actual file suffix is determined by the database module.

do_not_set_entry (filename, obj)

do_not_store_info (filename, node)

get_entry (filename)
    Fetch the specified entry attribute.

merge ()

set_entry (filename, obj)
    Set the entry.

store_info (filename, node)

write (sync=1)

class SCons.SConsign.Dir (fp=None, dir=None)
    Bases: SCons.SConsign.Base

    do_not_set_entry (filename, obj)

    do_not_store_info (filename, node)

    get_entry (filename)
        Fetch the specified entry attribute.

    merge ()

    set_entry (filename, obj)
        Set the entry.

    store_info (filename, node)

    write (sync=1)

class SCons.SConsign.DirFile (dir)
    Bases: SCons.SConsign.Dir
    Encapsulates reading and writing a per-directory .sconsign file.

    do_not_set_entry (filename, obj)

    do_not_store_info (filename, node)

    get_entry (filename)
        Fetch the specified entry attribute.

    merge ()

    set_entry (filename, obj)
        Set the entry.

    store_info (filename, node)

    write (sync=1)
        Write the .sconsign file to disk.
        Try to write to a temporary file first, and rename it if we succeed. If we can’t write to the temporary file, it’s probably because the directory isn’t writable (and if so, how did we build anything in this directory, anyway?), so
try to write directly to the .sconsign file as a backup. If we can’t rename, try to copy the temporary contents back to the .sconsign file. Either way, always try to remove the temporary file at the end.

SCons.SConsign.File (name, dbm_module=None)
Arrange for all signatures to be stored in a global .sconsign.db* file.

SCons.SConsign.ForDirectory 
alias of SCons.SConsign.DB

SCons.SConsign.Get_DataBase (dir)

SCons.SConsign.Reset ()
Reset global state. Used by unit tests that end up using SConsign multiple times to get a clean slate for each test.

class SCons.SConsign.SConsignEntry
Bases: object
Wrapper class for the generic entry in a .sconsign file. The Node subclass populates it with attributes as it pleases.
XXX As coded below, we do expect a ‘.binfo’ attribute to be added, but we’ll probably generalize this in the next refactorings.

binfo

convert_from_sconsign (dir, name)

convert_to_sconsign ()

current_version_id = 2

ninfo

SCons.SConsign.corrupt_dblite_warning (filename)

SCons.SConsign.write ()

---

SCons.Subst module

SCons string substitution.

class SCons.Subst_CmdStringHolder (cmd, literal=None)
Bases: collections.UserString
This is a special class used to hold strings generated by scons_subst() and scons_subst_list(). It defines a special method escape(). When passed a function with an escape algorithm for a particular platform, it will return the contained string with the proper escape sequences inserted.

_abc_impl = <_abc_data object>

capitalize ()

casefold ()

center (width, *args)

count (value) → integer – return number of occurrences of value

code (encoding=None, errors=None)

dendswith (suffix, start=0, end=9223372036854775807)

escapitalize ()

escape (escape_func, quote_func=<function quote_spaces>)
Escape the string with the supplied function. The function is expected to take an arbitrary string, then return it with all special characters escaped and ready for passing to the command interpreter.
After calling this function, the next call to str() will return the escaped string.
expandtabs (tabsize=8)

find (sub, start=0, end=9223372036854775807)

format (*args, **kwds)

format_map (mapping)

index (value[, start[, stop]]) → integer — return first index of value.
Raises ValueError if the value is not present.
Supporting start and stop arguments is optional, but recommended.

is_literal ()

isalnum ()

isalpha ()

isascii ()

isdecimal ()

isdigit ()

isidentifier ()

islower ()

isnumeric ()

isprintable ()

isspace ()

istitle ()

isupper ()

join (seq)

ljust (width, *args)

lower ()

lstrip (chars=None)

maketrans (y=None, z=None, /)
Return a translation table usable for str.translate().
If there is only one argument, it must be a dictionary mapping Unicode ordinals (integers) or characters to
Unicode ordinals, strings or None. Character keys will be then converted to ordinals. If there are two arguments,
they must be strings of equal length, and in the resulting dictionary, each character in x will be mapped to the
character at the same position in y. If there is a third argument, it must be a string, whose characters will be
mapped to None in the result.

partition (sep)

replace (old, new, maxsplit= - 1)

rfind (sub, start=0, end=9223372036854775807)

rindex (sub, start=0, end=9223372036854775807)
SCons Project API Documentation

\texttt{rjust (width, *args)}

\texttt{rpartition (sep)}

\texttt{rsplit (sep=None, maxsplit=-1)}

\texttt{rstrip (chars=None)}

\texttt{split (sep=None, maxsplit=-1)}

\texttt{splitlines (keepends=False)}

\texttt{startswith (prefix, start=0, end=9223372036854775807)}

\texttt{strip (chars=None)}

\texttt{swapcase ()}

\texttt{title ()}

\texttt{translate (*args)}

\texttt{upper ()}

\texttt{zfill (width)}

\texttt{class SCons.Subst.ListSubber (env, mode, conv, gvars)}

\texttt{Bases: collections.UserList}

A class to construct the results of a scons_subst_list() call.
Like StringSubber, this class binds a specific construction environment, mode, target and source with two methods (substitute() and expand()) that handle the expansion.
In addition, however, this class is used to track the state of the result(s) we're gathering so we can do the appropriate thing whenever we have to append another word to the result–start a new line, start a new word, append to the current word, etc. We do this by setting the “append” attribute to the right method so that our wrapper methods only need ever call ListSubber.append(), and the rest of the object takes care of doing the right thing internally.

\_abc\_impl = \_\_abc\_data object>

\texttt{add\_new\_word (x)}

\texttt{add\_to\_current\_word (x)}

Append the string x to the end of the current last word in the result. If that is not possible, then just add it as a new word. Make sure the entire concatenated string inherits the object attributes of x (in particular, the escape function) by wrapping it as CmdStringHolder.

\texttt{append (item)}

S.append(value) – append value to the end of the sequence

\texttt{clear () \rightarrow None} – remove all items from S

\texttt{close\_strip (x)}

Handle the “close strip” $) token.

\texttt{copy ()}

\texttt{count (value) \rightarrow integer} – return number of occurrences of value

\texttt{expand (s, lvars, within\_list)}

Expand a single “token” as necessary, appending the expansion to the current result.
This handles expanding different types of things (strings, lists, callables) appropriately. It calls the wrapper substitute() method to re-expand things as necessary, so that the results of expansions of side-by-side strings still get re-evaluated separately, not smushed together.

expanded(s)
Determines if the string s requires further expansion. Due to the implementation of ListSubber expand will call itself 2 additional times for an already expanded string. This method is used to determine if a string is already fully expanded and if so exit the loop early to prevent these recursive calls.

extend(other)
S.extend(iterable) – extend sequence by appending elements from the iterable

index(value[, start[, stop]]) → integer – return first index of value. Raises ValueError if the value is not present. Supporting start and stop arguments is optional, but recommended.

insert (i, item)
S.insert(index, value) – insert value before index

literal(x)

next_line()
Arrange for the next word to start a new line. This is like starting a new word, except that we have to append another line to the result.

next_word()
Arrange for the next word to start a new word.

open_strip(x)
Handle the “open strip” $( token.

pop([, index]) → item – remove and return item at index (default last). Raise IndexError if list is empty or index is out of range.

remove(item)
S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse()
S.reverse() – reverse IN PLACE

sort (*args,**kwds)

substitute(args, lvars, within_list)
Substitute expansions in an argument or list of arguments. This serves as a wrapper for splitting up a string into separate tokens.

this_word()
Arrange for the next word to append to the end of the current last word in the result.

class SCons.Subst.Literal (lstr)
Bases: object
A wrapper for a string. If you use this object wrapped around a string, then it will be interpreted as literal. When passed to the command interpreter, all special characters will be escaped.

escape(escape_func)

for_signature()

is_literal()
class SCons.Subst.NLWrapper (list, func)
Bases: object
A wrapper class that delays turning a list of sources or targets into a NodeList until it's needed. The specified function supplied when the object is initialized is responsible for turning raw nodes into proxies that implement the special attributes like .abspath, .source, etc. This way, we avoid creating those proxies just "in case" someone is going to use $TARGET or the like, and only go through the trouble if we really have to.

In practice, this might be a wash performance-wise, but it's a little cleaner conceptually...

_create_nodelist ()
_gen_nodelist ()
_return_nodelist ()

class SCons.Subst.NullNodeList (*args, **kwargs)
Bases: SCons.Util.NullSeq

_instance
SCons.Subst.NullNodesList
SCons.Subst.SetAllowableExceptions (*excepts)

class SCons.Subst.SpecialAttrWrapper (lstr, for_signature=None)
Bases: object
This is a wrapper for what we call a 'Node special attribute.' This is any of the attributes of a Node that we can reference from Environment variable substitution, such as $TARGET.abspath or $SOURCES[1].filebase. We implement the same methods as Literal so we can handle special characters, plus a for_signature method, such that we can return some canonical string during signature calculation to avoid unnecessary rebuilds.

escape (escape_func)

for_signature ()

is_literal ()

class SCons.Subst.StringSubber (env, mode, conv, gvars)
Bases: object
A class to construct the results of a scons_subst() call.
This binds a specific construction environment, mode, target and source with two methods (substitute() and expand()) that handle the expansion.

expand (s, lvars)
Expand a single "token" as necessary, returning an appropriate string containing the expansion. This handles expanding different types of things (strings, lists, callables) appropriately. It calls the wrapper substitute() method to re-expand things as necessary, so that the results of expansions of side-by-side strings still get re-evaluated separately, not smushed together.

substitute (args, lvars)
Substitute expansions in an argument or list of arguments. This serves as a wrapper for splitting up a string into separate tokens.

class SCons.Subst.Target_or_Source (nl)
Bases: object
A class that implements $TARGET or $SOURCE expansions by in turn wrapping a NLWrapper. This class handles the different methods used to access an individual proxy Node, calling the NLWrapper to create a proxy on demand.

class SCons.Subst.Targets_or_Sources (nl)
Bases: collections.UserList
A class that implements $TARGETS or $SOURCES expansions by in turn wrapping a NLWrapper. This class
handles the different methods used to access the list, calling the NLWrapper to create proxies on demand.
Note that we subclass collections.UserList purely so that the is_Sequence() function will identify an object of this
class as a list during variable expansion. We’re not really using any collections.UserList methods in practice.

```python
_abc_impl = <_abc_data object>
```

**append (item)**

S.append(value) – append value to the end of the sequence

**clear ()**

None – remove all items from S

**count (value)**

integer – return number of occurrences of value

**extend (other)**

S.extend(iterable) – extend sequence by appending elements from the iterable

**index (value[, start[, stop]])**

integer – return first index of value. Raises ValueError if the value is not present.
Supporting start and stop arguments is optional, but recommended.

**insert (i, item)**

S.insert(index, value) – insert value before index

**pop ([, index])**

item – remove and return item at index (default last). Raise IndexError if list is empty or index is out of range.

**remove (item)**

S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

**reverse ()**

S.reverse() – reverse IN PLACE

**sort (**args, **kwds)**

SCons.Subst._remove_list (list)

SCons.Subst._rm_list (list)

SCons.Subst.escape_list (mylist, escape_func)

Escape a list of arguments by running the specified escape_func on every object in the list that has an escape() method.

SCons.Subst.quote_spaces (arg)

Generic function for putting double quotes around any string that has white space in it.

SCons.Subst.raise_exception (exception, target, s)

SCons.Subst.scons_subst (strSubst, env, mode=1, target=None, source=None, gvars={}, lvars={}, conv=None)

Expand a string or list containing construction variable substitutions.
The companion scons_subst_list() function (below) handles separating command lines into lists of arguments, so see that function if that’s what you’re looking for.

SCons.Subst.scons_subst_list (strSubst, env, mode=1, target=None, source=None, gvars={}, lvars={}, conv=None)

Substitute construction variables in a string (or list or other object) and separate the arguments into a command list.
The companion scons_subst() function (above) handles basic substitutions within strings, so see that function instead if that’s what you’re looking for.

SCons.Subst.scons_subst_once (strSubst, env, key)

Perform single (non-recursive) substitution of a single construction variable keyword.
This is used when setting a variable when copying or overriding values in an Environment. We want to capture (expand) the old value before we override it, so people can do things like:

```python
env2 = env.Clone(CCFLAGS = '$CCFLAGS -g')
```

We do this with some straightforward, brute-force code here…

SCons.Subst.

```
SCons.Subst .subst_dict (target, source)

Create a dictionary for substitution of special construction variables.
This translates the following special arguments:

- **target** - the target (object or array of objects),
  used to generate the TARGET and TARGETS construction variables
- **source** - the source (object or array of objects),
  used to generate the SOURCES and SOURCE construction variables
```

## SCons.Taskmaster module

Generic Taskmaster module for the SCons build engine.

This module contains the primary interface(s) between a wrapping user interface and the SCons build engine. There are two key classes here:

**Taskmaster**

This is the main engine for walking the dependency graph and calling things to decide what does or doesn’t need to be built.

**Task**

This is the base class for allowing a wrapping interface to decide what does or doesn’t actually need to be done. The intention is for a wrapping interface to subclass this as appropriate for different types of behavior it may need.

The canonical example is the SCons native Python interface, which has Task subclasses that handle its specific behavior, like printing “foo” is up to date” when a top-level target doesn’t need to be built, and handling the -c option by removing targets as its “build” action. There is also a separate subclass for suppressing this output when the -q option is used.

The Taskmaster instantiates a Task object for each (set of) target(s) that it decides need to be evaluated and/or built.

**class** SCons.Taskmaster.

```
SCons.Taskmaster.

AlwaysTask (tm, targets, top, node)

Bases: SCons.Taskmaster.

TASK

_alget_impl = <_abc_data object>

_exception_raise ()

Raises a pending exception that was recorded while getting a Task ready for execution.

_no_exception_to_raise ()

display (message)

Hook to allow the calling interface to display a message.
This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

_exc_clear ()

Clears any recorded exception.
This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

_exc_info ()

Returns info about a recorded exception.
exception_set (exception=None)
Records an exception to be raised at the appropriate time.
This also changes the "exception_raise" attribute to point to the method that will, in fact

eexecute ()
Called to execute the task.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
unsafe stuff in prepare(), executed() or failed().

executed ()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node's
callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node's state before
deciding whether it was "built", in which case we call the appropriate Node method. In any event, we always call
"visited()", which will handle any post-visit actions that must take place regardless of whether or not the target
was an actual built target or a source Node.

executed_with_callbacks ()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node's
callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node's state before
deciding whether it was "built", in which case we call the appropriate Node method. In any event, we always call
"visited()", which will handle any post-visit actions that must take place regardless of whether or not the target
was an actual built target or a source Node.

executed_without_callbacks ()
Called when the task has been successfully executed and the Taskmaster instance doesn't want to call the
Node's callback methods.

fail_continue ()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

fail_stop ()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

failed ()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

get_target ()
Fetch the target being built or updated by this task.

make_ready ()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all ()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the "scons
-c" option.

make_ready_current ()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.
needs_execute()  
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t. their dependencies) can use this as follows:

```python
class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute
```

postprocess()  
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

prepare()  
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

trace_message(method, node, description='node')

class SCons.Taskmaster.OutOfDateTask(tm, targets, top, node)  
Bases: SCons.Taskmaster.Task

_exception_raise()  
Raises a pending exception that was recorded while getting a Task ready for execution.

_no_exception_to_raise()

display(message)  
Hook to allow the calling interface to display a message.
This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

exc_clear()  
Clears any recorded exception.
This also changes the "exception_raise" attribute to point to the appropriate do-nothing method.

exc_info()  
Returns info about a recorded exception.

exception_set(exception=None)  
Records an exception to be raised at the appropriate time.
This also changes the "exception_raise" attribute to point to the method that will, in fact

execute()  
Called to execute the task.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in prepare(), executed() or failed().

executed()  
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.
executed_with_callbacks()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_without_callbacks()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the Node’s callback methods.

fail_continue()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons -c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Returns True (indicating this Task should be executed) if this Task’s target state indicates it needs executing, which has already been determined by an earlier up-to-date check.

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

trace_message(method, node, description='node')
class SCons.Taskmaster.Stats
Bases: object
A simple class for holding statistics about the disposition of a Node by the Taskmaster. If we’re collecting statistics, each Node processed by the Taskmaster gets one of these attached, in which case the Taskmaster records its decision each time it processes the Node. (Ideally, that’s just once per Node.)

class SCons.Taskmaster.Task (tm, targets, top, node)
Bases: abc.ABC
SCons build engine abstract task class.
This controls the interaction of the actual building of node and the rest of the engine.
This is expected to handle all of the normally-customizable aspects of controlling a build, so any given application should be able to do what it wants by sub-classing this class and overriding methods as appropriate. If an application needs to customize something by sub-classing Taskmaster (or some other build engine class), we should first try to migrate that functionality into this class.
Note that it’s generally a good idea for sub-classes to call these methods explicitly to update state, etc., rather than roll their own interaction with Taskmaster from scratch.

_abc_impl = <_abc_data object>

_exception_raise ()
 Raises a pending exception that was recorded while getting a Task ready for execution.

_no_exception_to_raise ()

display (message)
 Hook to allow the calling interface to display a message.
This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

exc_clear ()
 Clears any recorded exception.
This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

exc_info ()
 Returns info about a recorded exception.

exception_set (exception=None)
 Records an exception to be raised at the appropriate time.
This also changes the “exception_raise” attribute to point to the method that will, in fact

execute ()
 Called to execute the task.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in prepare(), executed() or failed().

executed ()
 Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_with_callbacks ()
 Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
“visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_without_callbacks()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the Node’s callback methods.

fail_continue()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited–the canonical example being the “scons -c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

abstract needs_execute()

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

trace_message (method, node, description='node')
class SCons.Taskmaster.Taskmaster (targets=[], tasker=None, order=None, trace=None)
Bases: object
The Taskmaster for walking the dependency DAG.

_find_next_ready_node()
Finds the next node that is ready to be built.
This is the main guts of the DAG walk. We loop through the list of candidates, looking for something that has no un-built children (i.e., that is a leaf Node or has dependencies that are all leaf Nodes or up-to-date). Candidate Nodes are re-scanned (both the target Node itself and its sources, which are always scanned in the context of a given target) to discover implicit dependencies. A Node that must wait for some children to be built will be put back on the candidates list after the children have finished building. A Node that has been put back on the candidates list in this way may have itself (or its sources) re-scanned, in order to handle generated header files (e.g.) and the implicit dependencies therein.

Note that this method does not do any signature calculation or up-to-date check itself. All of that is handled by the Task class. This is purely concerned with the dependency graph walk.

_validate_pending_children()
.Validate the content of the pending_children set. Assert if an internal error is found.
This function is used strictly for debugging the taskmaster by checking that no invariants are violated. It is not used in normal operation.
The pending_children set is used to detect cycles in the dependency graph. We call a “pending child” a child that is found in the “pending” state when checking the dependencies of its parent node.
A pending child can occur when the Taskmaster completes a loop through a cycle. For example, let’s imagine a graph made of three nodes (A, B and C) making a cycle. The evaluation starts at node A. The Taskmaster first considers whether node A’s child B is up-to-date. Then, recursively, node B needs to check whether node C is up-to-date. This leaves us with a dependency graph looking like:

```
Next candidate
^          |
+-----------------------+
```

Now, when the Taskmaster examines the Node C’s child Node A, it finds that Node A is in the “pending” state. Therefore, Node A is a pending child of node C.
Pending children indicate that the Taskmaster has potentially loop back through a cycle. We say potentially because it could also occur when a DAG is evaluated in parallel. For example, consider the following graph:

```
Node A (Pending) --> Node B (Pending) --> Node C (Pending) --> ...
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>+-------------+---------------</td>
<td></td>
</tr>
</tbody>
</table>
|               | Node D (NoState) +|--
|                |             /  |
|                | Next candidate |
```

The Taskmaster first evaluates the nodes A, B, and C and starts building some children of node C. Assuming, that the maximum parallel level has not been reached, the Taskmaster will examine Node D. It will find that Node C is a pending child of Node D.
In summary, evaluating a graph with a cycle will always involve a pending child at one point. A pending child might indicate either a cycle or a diamond-shaped DAG. Only a fraction of the nodes ends-up being a “pending child” of another node. This keeps the pending_children set small in practice.
We can differentiate between the two cases if we wait until the end of the build. At this point, all the pending children nodes due to a diamond-shaped DAG will have been properly built (or will have failed to build). But, the pending children involved in a cycle will still be in the pending state.
The taskmaster removes nodes from the pending_children set as soon as a pending_children node moves out of the pending state. This also helps to keep the pending_children set small.

cleanup()
Check for dependency cycles.

find_next_candidate()
Returns the next candidate Node for (potential) evaluation.
The candidate list (really a stack) initially consists of all of the top-level (command line) targets provided when the Taskmaster was initialized. While we walk the DAG, visiting Nodes, all the children that haven't finished processing get pushed on to the candidate list. Each child can then be popped and examined in turn for whether their children are all up-to-date, in which case a Task will be created for their actual evaluation and potential building.
Here is where we also allow candidate Nodes to alter the list of Nodes that should be examined. This is used, for example, when invoking SCons in a source directory. A source directory Node can return its corresponding build directory Node, essentially saying, “Hey, you really need to build this thing over here instead.”

**next_task()**
- Returns the next task to be executed.
  - This simply asks for the next Node to be evaluated, and then wraps it in the specific Task subclass with which we were initialized.

**no_next_candidate()**
- Stops Taskmaster processing by not returning a next candidate.
  - Note that we have to clean-up the Taskmaster candidate list because the cycle detection depends on the fact all nodes have been processed somehow.

**stop()**
- Stops the current build completely.

**trace_message(message)**

**trace_node(node)**

**will_not_build(nodes, node_func=<function Taskmaster.<lambda>>)**
- Perform clean-up about nodes that will never be built. Invokes a user defined function on all of these nodes (including all of their parents).

SCons.Taskmaster.dump_stats()

SCons.Taskmaster.find_cycle(stack, visited)

---

### SCons.Util module

Various SCons utility functions.

**SCons.Util.AddMethod(obj, function, name=None)**
- Adds a method to an object.
  - Adds function to obj if obj is a class object. Adds function as a bound method if obj is an instance object. If obj looks like an environment instance, use MethodWrapper to add it. If name is supplied it is used as the name of function.
  - Although this works for any class object, the intent as a public API is to be used on Environment, to be able to add a method to all construction environments; it is preferred to use env.AddMethod to add to an individual environment.

```python
>>> class A:
...    ...
...    ...

>>> a = A()

>>> def f(self, x, y):
...    ...    self.z = x + y

>>> AddMethod(A, f, "add")
>>> a.add(2, 4)
>>> print(a.z)
6
>>> a.data = ['a', 'b', 'c', 'd', 'e', 'f']
>>> AddMethod(a, lambda self, i: self.data[i], "listIndex")
>>> print(a.listIndex(3))

SCons.Util.AddPathIfNotExists(env_dict, key, path, sep=":")
- Add a path element to a construction variable.
key is looked up in env_dict, and path is added to it if it is not already present. env_dict[key] is assumed to be in the format of a PATH variable: a list of paths separated by sep tokens. Example:

```python
>>> env = {'PATH': '/bin:/usr/bin:/usr/local/bin'}
>>> AddPathIfNotExists(env, 'PATH', '/opt/bin')
>>> print(env['PATH'])
/opt/bin:/bin:/usr/bin:/usr/local/bin
```

SCons.Util.AppendPath (oldpath, newpath, sep=':', delete_existing=True, canonicalize=None) → Union[list, str]  
Appends newpath path elements to oldpath.  
Will only add any particular path once (leaving the last one it encounters and ignoring the rest, to preserve path order), and will os.path.normpath and os.path.normcase all paths to help assure this. This can also handle the case where oldpath is a list instead of a string, in which case a list will be returned instead of a string. For example:

```python
>>> p = AppendPath("/foo/bar:/foo", ", /biz/boom:/foo")
>>> print(p)
/foo/bar:/biz/boom:/foo
```

If delete_existing is False, then adding a path that exists will not move it to the end; it will stay where it is in the list.

```python
>>> p = AppendPath("/foo/bar:/foo", ", /biz/boom:/foo", delete_existing=False)
>>> print(p)
/foo/bar:/foo:/biz/boom
```

If canonicalize is not None, it is applied to each element of newpath before use.

class SCons.Util.CLVar (initlist=None)
Bases: collections.UserList
A container for command-line construction variables.  
Forces the use of a list of strings intended as command-line arguments. Like collections.UserList, but the argument passed to the initializer will be processed by the Split() function, which includes special handling for string types: they will be split into a list of words, not coerced directly to a list. The same happens if a string is added to a CLVar, which allows doing the right thing with both Append()/Prepend() methods, as well as with pure Python addition, regardless of whether adding a list or a string to a construction variable.
Side effect: spaces will be stripped from individual string arguments. If you need spaces preserved, pass strings containing spaces inside a list argument.

```python
>>> u = UserList("--some --opts and args")
>>> print(len(u), repr(u))
22 ['-', '-', 's', 'o', 'm', 'e', ' ', '-', '-', 'o', 'p', 't', 's', ' ', 'a', 'n', 'd', ' ', 'a', 'r', 'g', 's']
>>> c = CLVar("--some --opts and args")
>>> print(len(c), repr(c))
4 ['--some', '--opts', 'and', 'args']
>>> c += "    strips spaces    
>>> print(len(c), repr(c))
6 ['--some', '--opts', 'and', 'args', 'strips', 'spaces']
```
index \((value[, \text{start}[,...,\text{stop}]])\) → integer – return first index of value.
   Raises ValueError if the value is not present.
   Supporting start and stop arguments is optional, but recommended.

```
S.insert(index, value) – insert value before index
```

```
S.pop([index]) → item – remove and return item at index (default last).
   Raise IndexError if list is empty or index is out of range.
```

```
S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.
```

```
S.reverse() – reverse \textit{IN PLACE}
```

```
S.sort(*args, **kwds)
```

```python
class SCons.Util.Delegate (attribute)
Bases: object
A Python Descriptor class that delegates attribute fetches to an underlying wrapped subject of a Proxy. Typical use:

```python
class Foo(Proxy):
    __str__ = Delegate('__str__')
```

```python
class SCons.Util.DisplayEngine
Bases: object
A callable class used to display SCons messages.
```

```
prompt_it = True
```

```
set_mode (mode)
```

```
SCons.Util.IDX (n) → bool
   Generate in index into strings from the tree legends.
   These are always a choice between two, so bool works fine.
```

```python
class SCons.Util.LogicalLines (fileobj)
Bases: object
Wrapper class for the logical_lines method.
   Allows us to read all “logical” lines at once from a given file object.
```

```
readlines ()
```

```
SCons.Util.MD5collect (signatures)
   Deprecated. Use \texttt{hash\_collect()} instead.
```

```
SCons.Util.MD5filesignature (fname, chunksize=65536)
   Deprecated. Use \texttt{hash\_file\_signature()} instead.
```

```
SCons.Util.MD5signature (s)
   Deprecated. Use \texttt{hash\_signature()} instead.
```

```python
class SCons.Util.MethodWrapper (obj, method, name=None)
Bases: object
A generic Wrapper class that associates a method with an object.
As part of creating this MethodWrapper object an attribute with the specified name (by default, the name of the supplied method) is added to the underlying object. When that new “method” is called, our \texttt{\_call\_()} method adds the object as the first argument, simulating the Python behavior of supplying “self” on method calls.
```
We hang on to the name by which the method was added to the underlying base class so that we can provide a method to “clone” ourselves onto a new underlying object being copied (without which we wouldn’t need to save that info).

```python
clone(new_object)
```

Returns an object that re-binds the underlying “method” to the specified new object.

```python
class SCons.Util NodeList (initlist=None)
Bases: collections.UserList
A list of Nodes with special attribute retrieval.
This class is almost exactly like a regular list of Nodes (actually it can hold any object), with one important difference. If you try to get an attribute from this list, it will return that attribute from every item in the list. For example:

```python
>>> someList = NodeList([' foo ', ' bar '])
>>> someList.strip()
['foo', 'bar']
```
```

append (item)
S.append(value) – append value to the end of the sequence

clear () → None – remove all items from S

copy ()

count (value) → integer – return number of occurrences of value

extend (other)
S.extend(iterable) – extend sequence by appending elements from the iterable

index (value[, start[, stop]]) → integer – return first index of value.
Raises ValueError if the value is not present.
Supporting start and stop arguments is optional, but recommended.

insert (i, item)
S.insert(index, value) – insert value before index

pop ([, index]) → item – remove and return item at index (default last).
Raise IndexError if list is empty or index is out of range.

remove (item)
S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
S.reverse() – reverse IN PLACE

sort (*args, **kwds)

class SCons.Util Null (*args, **kwargs)
Bases: object
Null objects always and reliably “do nothing.”

class SCons.Util NullSeq (*args, **kwargs)
Bases: SCons.Util.Null
A Null object that can also be iterated over.

SCons.Util.PrependPath (oldpath, newpath, sep=':', delete_existing=True, canonicalize=None) → Union[list, str]
Prepends newpath path elements to oldpath.
Will only add any particular path once (leaving the first one it encounters and ignoring the rest, to preserve path order), and will `os.path.normpath` and `os.path.normcase` all paths to help assure this. This can also handle the case where `oldpath` is a list instead of a string, in which case a list will be returned instead of a string. For example:

```python
>>> p = PrependPath("/foo/bar:/foo", "/biz/boom:/foo")
>>> print(p)
/biz/boom:/foo:/foo/bar
```

If `delete_existing` is False, then adding a path that exists will not move it to the beginning; it will stay where it is in the list.

```python
>>> p = PrependPath("/foo/bar:/foo", "/biz/boom:/foo", delete_existing=False)
>>> print(p)
/biz/boom:/foo/bar:/foo
```

If `canonicalize` is not None, it is applied to each element of `newpath` before use.

```python
class SCons.Util.Proxy (subject)
Bases: object
A simple generic Proxy class, forwarding all calls to subject.
This means you can take an object, let’s call it `obj_a`, and wrap it in this Proxy class, with a statement like this:
```proxy_obj = Proxy(obj_a)```

Then, if in the future, you do something like this:
```x = proxy_obj.var1```since the `Proxy` class does not have a `var1` attribute (but presumably `objA` does), the request actually is equivalent to saying:
```x = obj_a.var1```Inherit from this class to create a Proxy.
With Python 3.5+ this does not work transparently for Proxy subclasses that use special `. __*__() method names, because those names are now bound to the class, not the individual instances. You now need to know in advance which special method names you want to pass on to the underlying Proxy object, and specifically delegate their calls like this:
```class Foo(Proxy):
    __str__ = Delegate(' __str__') ```

```get() ```Retrieve the entire wrapped object

SCons.Util.RegError 
alias of SCons.Util._NoError

SCons.Util.RegGetValue (root, key)
SCons.Util.RegOpenKeyEx (root, key)

```class SCons.Util.Selector
Bases: collections.OrderedDict
A callable ordered dictionary that maps file suffixes to dictionary values. We preserve the order in which items are added so that `get_suffix()` calls always return the first suffix added.
```clear () → None. Remove all items from od.

copy () → a shallow copy of od

fromkeys (value=None) 
Create a new ordered dictionary with keys from iterable and values set to value.
get(key, default=None, /)  
Return the value for key if key is in the dictionary, else default.

items() → a set-like object providing a view on D’s items

keys() → a set-like object providing a view on D’s keys

move_to_end(key, last=True)  
Move an existing element to the end (or beginning if last is false).  
Raise KeyError if the element does not exist.

pop(k[, d]) → v, remove specified key and return the corresponding value. If key is not found, d is returned if given, otherwise KeyError is raised.

popitem(last=True)  
Remove and return a (key, value) pair from the dictionary. Pairs are returned in LIFO order if last is true or FIFO order if false.

setdefault(key, default=None)  
Insert key with a value of default if key is not in the dictionary. Return the value for key if key is in the dictionary, else default.

update([E], **F) → None. Update D from dict/iterable E and F. If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

values() → an object providing a view on D’s values

SCons.Util.Split(arg) → list  
Returns a list of file names or other objects. If arg is a string, it will be split on strings of white-space characters within the string. If arg is already a list, the list will be returned untouched. If arg is any other type of object, it will be returned as a list containing just the object.

```python
>>> print(Split(" this is a string "))
['this', 'is', 'a', 'string']
>>> print(Split(["stringlist", " preserving ", " spaces "]))
['stringlist', ' preserving ', ' spaces ']
```

class SCons.Util.Unbuffered(file)  
A proxy that wraps a file object, flushing after every write. Delegates everything else to the wrapped object.

write(arg)

writelines(arg)

class SCons.Util.UniqueList(initlist=None)  
A list which maintains uniqueness. Uniquing is lazy: rather than being assured on list changes, it is fixed up on access by those methods which need to act on a unique list to be correct. That means things like “in” don’t have to eat the uniquing time.

__make_unique()  
_abc_impl = <_abc_data object>  
append(item)  
  S.append(value) – append value to the end of the sequence  

clear() → None – remove all items from S
copy ()

count (value) → integer – return number of occurrences of value

extend (other)
    S.extend(iterable) – extend sequence by appending elements from the iterable

index (value[, start[, stop]]) → integer – return first index of value.
    Raises ValueError if the value is not present.
    Supporting start and stop arguments is optional, but recommended.

insert (i, item)
    S.insert(index, value) – insert value before index

pop ([l, index]) → item – remove and return item at index (default last).
    Raise IndexError if list is empty or index is out of range.

remove (item)
    S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
    S.reverse() – reverse IN PLACE

sort (*args,**kwds)

SCons.Util.WhereIs (file, path=None, pathext=None, reject=None) → Optional[str]
    Return the path to an executable that matches file.
    Searches the given path for file, respecting any filename extensions pathext (on the Windows platform only), and
    returns the full path to the matching command. If no command is found, return None.
    If path is not specified, os.environ[PATH] is used. If pathext is not specified, os.environ[PATHEXT] is used.
    Will not select any path name or names in the optional reject list.

exception SCons.Util._NoError
    Bases: Exception

    args

    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.Util._get_hash_object (hash_format)
    Allocates a hash object using the requested hash format.
    Parameters: hash_format – Hash format to use.
    Returns: hashlib object.

SCons.Util._semi_deepecopy_list (obj) → list

SCons.Util._semi_deepecopy_tuple (obj) → tuple

SCons.Util._show_md5_warning (function_name)
    Shows a deprecation warning for various MD5 functions.

SCons.Util.adjustixes (fname, pre, suf, ensure_suffix=False) → str
    Adjust filename prefixes and suffixes as needed.
    Add prefix to fname if specified. Add suffix to fname if specified and if ensure_suffix is True

SCons.Util.case_sensitive_suffixes (s1, s2) → bool

SCons.Util.cmp (a, b) → bool
    A cmp function because one is no longer available in python3.

SCons.Util.containsAll (s, pat) → bool
    Check whether string s contains ALL of the items in pat.

SCons.Util.containsAny (s, pat) → bool
Check whether string \( s \) contains ANY of the items in \( \text{pat} \).

\[
\text{SCons.Util.containsOnly}(s, \text{pat}) \rightarrow \text{bool}
\]
Check whether string \( s \) contains ONLY items in \( \text{pat} \).

\[
\text{SCons.Util.dictify}(\text{keys}, \text{values}, \text{result}={}\text{None}) \rightarrow \text{dict}
\]

\[
\text{SCons.Util.do_flatten}(\text{sequence}, \text{result}, \text{isinstance}=<\text{built-in function } \text{isinstance}>, \text{StringTypes}=\langle \text{class 'str'}\rangle, \text{SequenceTypes}=\langle \langle \langle \text{class 'list'}\rangle, \text{class 'tuple'}\rangle, \text{class 'collections.UserList'}\rangle, \text{class 'collections.abc.MappingView'}\rangle)
\]

\[
\text{SCons.Util.flatten}(\text{obj}, \text{isinstance}=\langle \text{built-in function } \text{isinstance}>, \text{StringTypes}=\langle \text{class 'str'}\rangle, \text{SequenceTypes}=\langle \langle \langle \text{class 'list'}\rangle, \text{class 'tuple'}\rangle, \text{class 'collections.UserList'}\rangle, <\text{class 'collections.abc.MappingView'}\rangle), \text{do_flatten}=\langle \text{function do_flatten} \rangle) \rightarrow \text{list}
\]

Flatten a sequence to a non-nested list.
Converts either a single scalar or a nested sequence to a non-nested list. Note that \text{flatten()} \ considers strings to be scalars instead of sequences like pure Python would.

\[
\text{SCons.Util.flatten_sequence}(\text{sequence}, \text{isinstance}=\langle \text{built-in function } \text{isinstance}>, \text{StringTypes}=\langle \langle \langle \text{class 'str'}\rangle, \text{class 'collections.UserString'}\rangle, \text{SequenceTypes}=\langle \langle \langle \text{class 'list'}\rangle, \text{class 'tuple'}\rangle, \text{class 'collections.UserList'}\rangle, <\text{class 'collections.abc.MappingView'}\rangle), \text{do_flatten}=\langle \text{function do_flatten} \rangle) \rightarrow \text{list}
\]

Flatten a sequence to a non-nested list.
Same as \text{flatten()}, but it does not handle the single scalar case. This is slightly more efficient when one knows that the sequence to flatten cannot be a scalar.

\[
\text{SCons.Util.get_env_bool}(\text{env}, \text{name}, \text{default}=\text{False}) \rightarrow \text{bool}
\]
Convert a construction variable to bool.
If the value of \text{name} in \text{env} is ‘true’, ‘yes’, ‘y’, ‘on’ (case insensitive) or anything convertible to int that yields non-zero then return True; if ‘false’, ‘no’, ‘n’, ‘off’ (case insensitive) or a number that converts to integer zero return False. Otherwise, return \text{default}.

\[
\text{Parameters:}
\begin{align*}
\text{env} & \quad \text{construction environment, or any dict-like object} \\
\text{name} & \quad \text{name of the variable} \\
\text{default} & \quad \text{value to return if } \text{name} \text{ not in } \text{env} \text{ or cannot be converted (default: False)}
\end{align*}
\]

\[
\text{Returns:} \quad \text{the “truthiness” of } \text{name}
\]

\[
\text{SCons.Util.get_environment_var}(\text{varstr}) \rightarrow \text{Optional[}\text{str}]\]
Return undecorated construction variable string.
Determine if \text{varstr} looks like a reference to a single environment variable, like “$FOO” or “${FOO}”. If so, return that variable with no decorations, like “FOO”. If not, return None.

\[
\text{SCons.Util.get_hash_format}() \rightarrow \text{Optional[}\text{str}]
\]
Retrieves the hash format or None if not overridden.
A return value of None does not guarantee that MD5 is being used; instead, it means that the default precedence order documented in \text{SCons.Util.set_hash_format()} is respected.

\[
\text{SCons.Util.get_native_path}(\text{path}) \rightarrow \text{str}
\]
Transform an absolute path into a native path for the system.
In Cygwin, this converts from a Cygwin path to a Windows path, without regard to whether \text{path} refers to an existing file system object. For other platforms, \text{path} is unchanged.

\[
\text{SCons.Util.get_os_env_bool}(\text{name}, \text{default}=\text{False}) \rightarrow \text{bool}
\]
Convert an environment variable to bool.
Conversion is the same as for \text{get_env_bool()}.

\[
\text{SCons.Util.hash_collect}(\text{signatures}, \text{hash_format}=\text{None}) \rightarrow \text{list}
\]
Collects a list of signatures into an aggregate signature.

\[
\text{Parameters:}
\begin{align*}
\text{signatures} & \quad \text{a list of signatures} \\
\text{hash_format} & \quad \text{Specify to override default hash format}
\end{align*}
\]

\[
\text{Returns:} \quad \text{the aggregate signature}
\]
SCons.Util.hash_file_signature (fname, chunksize=65536, hash_format=None)
Generate the md5 signature of a file

Parameters:
- `fname` – file to hash
- `chunksize` – chunk size to read
- `hash_format` – Specify to override default hash format

Returns: String of Hex digits representing the signature

SCons.Util.hash_signature (s, hash_format=None)
Generate hash signature of a string

Parameters:
- `s` – either string or bytes. Normally should be bytes
- `hash_format` – Specify to override default hash format

Returns: String of hex digits representing the signature

SCons.Util.is_Dict (obj, isinstance=<built-in function isinstance>, DictTypes=(<class 'dict'>, <class 'collections.UserDict'>)) → bool

SCons.Util.is_List (obj, isinstance=<built-in function isinstance>, ListTypes=(<class 'list'>, <class 'collections.UserList'>)) → bool

SCons.Util.is_Scalar (obj, isinstance=<built-in function isinstance>, StringTypes=(<class 'str'>, <class 'collections.UserString'>), SequenceTypes=(<class 'list'>, <class 'collections.UserList'>, <class 'collections.abc.MappingView'>)) → bool

SCons.Util.is_Sequence (obj, isinstance=<built-in function isinstance>, SequenceTypes=(<class 'list'>, <class 'tuple'>, <class 'collections.UserList'>, <class 'collections.abc.MappingView'>))) → bool

SCons.Util.is_String (obj, isinstance=<built-in function isinstance>, StringTypes=(<class 'str'>, <class 'collections.UserString'>)) → bool

SCons.Util.is_Tuple (obj, isinstance=<built-in function isinstance>, tuple=<class 'tuple'>) → bool

SCons.Util.logical_lines (physical_lines, joiner=<built-in method join of str object>)

SCons.Util.make_path_relative (path) → str
Converts an absolute path name to a relative pathname.

SCons.Util.print_time ()
Hack to return a value from Main if can’t import Main.

SCons.Util.print_tree (root, child_func, prune=0, showtags=False, margin=[0], visited=None, lastChild=False, singleLineDraw=False)
Print a tree of nodes.
This is like func:render_tree, except it prints lines directly instead of creating a string representation in memory, so that huge trees can be handled.

Parameters:
- `root` – the root node of the tree
- `child_func` – the function called to get the children of a node
- `prune` – don’t visit the same node twice
- `showtags` – print status information to the left of each node line
- `margin` – the format of the left margin to use for children of `root`. 1 results in a pipe, and 0 results in no pipe.
- `visited` – a dictionary of visited nodes in the current branch if prune is 0, or in the whole tree if prune is 1.
- `singleLineDraw` – use line-drawing characters rather than ASCII.

SCons.Util.render_tree (root, child_func, prune=0, margin=[0], visited=None)
Render a tree of nodes into an ASCII tree view.
Parameters:
- **root** – the root node of the tree
- **child_func** – the function called to get the children of a node
- **prune** – don’t visit the same node twice
- **margin** – the format of the left margin to use for children of root. 1 results in a pipe, and 0 results in no pipe.
- **visited** – a dictionary of visited nodes in the current branch if prune is 0, or in the whole tree if prune is 1.

SCons.Util.rightmost_separator(path, sep)
SCons.Util.semi_deepcopy(obj)
SCons.Util.semi_deepcopy_dict(obj, exclude=None) → dict
SCons.Util.set_hash_format(hash_format)
    Sets the default hash format used by SCons.  
    If hash_format is None or an empty string, the default is determined by this function.  
    Currently the default behavior is to use the first available format of the following options: MD5, SHA1, SHA256.
SCons.Util.silent_intern(x)
    Perform sys.intern on the passed argument and return the result. If the input is ineligible for interning the original argument is returned and no exception is thrown.
SCons.Util.splitext(path) → tuple
    Split path into a (root, ext) pair.  
    Same as os.path.splitext but faster.
SCons.Util.to_String(obj, isinstance=<built-in function isinstance>, str=<class 'str'>, UserString=<class 'collections.UserString'>, BaseStringTypes=<class 'str'>) → str
    Return a string version of obj.
SCons.Util.to_String_for_signature(obj, to_String_for_subst=<function to_String_for_subst>, AttributeError=<class 'AttributeError'>) → str
    Return a string version of obj for signature usage.  
    Like to_String_for_subst() but has special handling for scons objects that have a for_signature() method, and for dicts.
SCons.Util.to_string_for_subst(obj, isinstance=<built-in function isinstance>, str=<class 'str'>, SequenceTypes=(<class 'list'>, <class 'tuple'>, <class 'collections.UserList'>,<class 'collections.abc.MappingView'>), UserString=<class 'collections.UserString'>) → str
    Return a string version of obj for subst usage.
SCons.Util.to_bytes(s) → bytes
SCons.Util.to_str(s) → str
SCons.Util.unique(seq)
    Return a list of the elements in seq without duplicates, ignoring order.

```python
>>> mylist = unique([1, 2, 3, 1, 2, 3])
[1, 2, 3]
>>> print(sorted(mylist))
['a', 'b', 'c']
```

For best speed, all sequence elements should be hashable. Then unique() will usually work in linear time.
If not possible, the sequence elements should enjoy a total ordering, and if list(s).sort() doesn’t raise TypeError it’s assumed that they do enjoy a total ordering. Then unique() will usually work in O(N*log2(N)) time.
If that’s not possible either, the sequence elements must support equality-testing. Then unique() will usually work in quadratic time.
SCons.Util.uniquer(seq, idfun=None)
SCons.Util.uniquer_hashables(seq)
SCons.Util.updrive(path) → str
   Make the drive letter (if any) upper case.
   This is useful because Windows is inconsistent on the case of the drive letter, which can cause inconsistencies
   when calculating command signatures.

SCons.Warnings module

The SCons warnings framework.

**exception** SCons.Warnings.CacheVersionWarning    
Bases: SCons.Warnings.WarningOnByDefault

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

**exception** SCons.Warnings.CacheWriteErrorWarning    
Bases: SCons.Warnings.SConsWarning

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

**exception** SCons.Warnings.CorruptSConsignWarning    
Bases: SCons.Warnings.WarningOnByDefault

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

**exception** SCons.Warnings.DependencyWarning    
Bases: SCons.Warnings.SConsWarning

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

**exception** SCons.Warnings.DeprecatedDebugOptionsWarning    
Bases: SCons.Warnings.MandatoryDeprecatedWarning

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

**exception** SCons.Warnings.DeprecatedMissingSConscriptWarning    
Bases: SCons.Warnings.DeprecatedWarning

**args**

**with_traceback()**
   Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
exception SCons.Warnings.DeprecatedOptionsWarning
    Bases: SCons.Warnings.MandatoryDeprecatedWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.DeprecatedSourceCodeWarning
    Bases: SCons.Warnings.FutureDeprecatedWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.DeprecatedWarning
    Bases: SCons.Warnings.SConsWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.DevelopmentVersionWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.DuplicateEnvironmentWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.FortranCxxMixWarning
    Bases: SCons.Warnings.LinkWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.FutureDeprecatedWarning
    Bases: SCons.Warnings.SConsWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.FutureReservedVariableWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
with_traceback ()
    Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.LinkWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.MandatoryDeprecatedWarning
    Bases: SCons.Warnings.DeprecatedWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.MisleadingKeywordsWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.MissingSConscriptWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.NoObjectCountWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.NoParallelSupportWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.PythonVersionWarning
    Bases: SCons.Warnings.DeprecatedWarning

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception SCons.Warnings.ReservedVariableWarning
    Bases: SCons.Warnings.WarningOnByDefault

    args
    with_traceback ()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
def with_traceback()
    Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.SConsWarning
    Bases: SCons.Errors.UserError

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.StackSizeWarning
    Bases: SCons.Warnings.WarningOnByDefault

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.TargetNotBuiltWarning
    Bases: SCons.Warnings.SConsWarning

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.TaskmasterNeedsExecuteWarning
    Bases: SCons.Warnings.DeprecatedWarning

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.VisualCMissingWarning
    Bases: SCons.Warnings.WarningOnByDefault

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.VisualStudioMissingWarning
    Bases: SCons.Warnings.SConsWarning

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

def exception SCons.Warnings.VisualVersionMismatch
    Bases: SCons.Warnings.WarningOnByDefault

    def with_traceback()
        Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
exception SCons.Warnings.WarningOnByDefault

Bases: SCons.Warnings.SConsWarning

args

with_traceback ()

    Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.Warnings.enableWarningClass (clazz)

    Enables all warnings of type clazz or derived from clazz.

SCons.Warnings.process_warn_strings (arguments)

    Process requests to enable/disable warnings.
    The requests are strings passed to the –warn option or the SetOption('warn') function.
    An argument to this option should be of the form “warning-class” or “no-warning-class”. The warning class is
    munged and has the suffix “Warning” added in order to get an actual class name from the classes above, which
    we need to pass to the {enable,disable}WarningClass() functions.
    For example, “deprecated” will enable the DeprecatedWarning class. “no-dependency” will disable the
    DependencyWarning class.
    As a special case, –warn=all and –warn=no-all will enable or disable (respectively) the base class of all SCons
    warnings.

SCons.Warnings.suppressWarningClass (clazz)

    Suppresses all warnings of type clazz or derived from clazz.

SCons.Warnings.warn (clazz, *args)

    Issue a warning, accounting for SCons rules.
    Check if warnings for this class are enabled. If warnings are treated as exceptions, raise exception. Use the global
    warning-emitter _warningOut, which allows selecting different ways of presenting a traceback (see Script/Main.py)

SCons.Warnings.warningAsException (flag=True)

    Set global _warningAsException flag.

    Parameters:   flag – value to set warnings-as-exceptions to [default: True]

    Returns:     The previous value.

### SCons.cpp module

SCons C Pre-Processor module

SCons.cpp.CPP_to_Python (s)

    Converts a C pre-processor expression into an equivalent Python expression that can be evaluated.

SCons.cpp.CPP_to_Python_Ops_Sub (m)

SCons.cpp.Cleanup_CPP_Expressions (ts)

class SCons.cpp.DumbPreProcessor (*args, **kw)

    Bases: SCons.cpp.PreProcessor

    A preprocessor that ignores all #if/#elif/#else/#endif directives and just reports back all of the #include files (like the
    classic SCons scanner did).
    This is functionally equivalent to using a regular expression to find all of the #include lines, only slower. It exists
    mainly as an example of how the main PreProcessor class can be sub-classed to tailor its behavior.

    _do_if_else_condition (condition)

        Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

    _match_tuples (tuples)

    _parse_tuples (contents)

    _process_tuples (tuples, file=None)

    all_include (!)
do_define (t)
Default handling of a #define line.

do_elif (t)
Default handling of a #elif line.

do_else (t)
Default handling of a #else line.

do_endif (t)
Default handling of a #endif line.

do_if (t)
Default handling of a #if line.

do_ifdef (t)
Default handling of a #ifdef line.

do ifndef (t)
Default handling of a #ifndef line.

do_import (t)
Default handling of a #import line.

do_include (t)
Default handling of a #include line.

do_include_next (t)
Default handling of a #include line.

do nothing (t)
Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

do_undef (t)
Default handling of a #undef line.

eval_expression (t)
Evaluates a C preprocessor expression. This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track #define values.

finalize_result (fname)

find_include_file (t)
Finds the #include file for a given preprocessor tuple.

initialize_result (fname)

process_contents (contents)
Pre-processes a file contents. Is used by tests

process_file (file)
Pre-processes a file. This is the main internal entry point.

read_file (file)

resolve_include (t)
Resolve a tuple-ized #include line.
This handles recursive expansion of values without "" or <> surrounding the name until an initial "" or < is found, to handle #include FILE where FILE is a #define somewhere else.

**restore ()**

Pops the previous dispatch table off the stack and makes it the current one.

**save ()**

Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

**scons_current_file ()**

**start_handling_includes (t=None)**

Causes the PreProcessor object to start processing #import, #include and #include_next lines. This method will be called when a #if, #ifdef, #ifndef or #elif evaluates True, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated False.

**stop_handling_includes (t=None)**

Causes the PreProcessor object to stop processing #import, #include and #include_next lines. This method will be called when a #if, #ifdef, #ifndef or #elif evaluates False, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated True.

**tupleize (contents)**

Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file. The first element of each tuple is the line's preprocessor directive (#if, #include, #define, etc., minus the initial '#'). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.

**class SCons.cpp.FunctionEvaluator** (name, args, expansion)

**Bases: object**

Handles delayed evaluation of a #define function call.

**class SCons.cpp.PreProcessor** (current='.', cpppath=(), dict={}, all=0, depth=-1)

**Bases: object**

The main workhorse class for handling C pre-processing.

**_do_if_else_condition (condition)**

Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

**_match_tuples (tuples)**

**_parse_tuples (contents)**

**_process_tuples (tuples, file=None)**

**all_include (t)**

**do_define ()**

Default handling of a #define line.

**do_elif ()**

Default handling of a #elif line.

**do_else ()**

Default handling of a #else line.

**do_endif ()**

Default handling of a #endif line.

**do_if ()**

Default handling of a #if line.

**do ifndef ()**
Default handling of a #ifdef line.

**do_ifndef ()**
Default handling of a #ifndef line.

Default handling of a #import line.

**do_import ()**
Default handling of a #include line.

**do_include ()**
Default handling of a #include line.

**do_include_next ()**
Default handling of a #include line.

**do_nothing ()**
Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

**do_undef ()**
Default handling of a #undef line.

**eval_expression ()**
Evaluates a C preprocessor expression.
This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track #define values.

**finalize_result (fname)**

**find_include_file ()**
Finds the #include file for a given preprocessor tuple.

**initialize_result (fname)**

**process_contents (contents)**
Pre-processes a file contents.
Is used by tests

**process_file (file)**
Pre-processes a file.
This is the main internal entry point.

**read_file (file)**

**resolve_include ()**
Resolve a tuple-ized #include line.
This handles recursive expansion of values without "" or <> surrounding the name until an initial " or < is found, to handle #include FILE where FILE is a #define somewhere else.

**restore ()**
Pops the previous dispatch table off the stack and makes it the current one.

**save ()**
Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

**scons_current_file ()**

**start_handling_includes (t=None)**
Causes the PreProcessor object to start processing #import, #include and #include_next lines.
This method will be called when a #if, #ifdef, #ifndef or #elif evaluates True, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated False.

**stop_handling_includes (t=None)**
Causes the PreProcessor object to stop processing #import, #include and #include_next lines.
This method will be called when a #if, #ifdef, #ifndef or #elif evaluates False, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated True.

tuplize (contents)
Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file.
The first element of each tuple is the line's preprocessor directive (#if, #include, #define, etc., minus the initial ‘#’). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.

SCons.dblite module

dblite.py module contributed by Ralf W. Grosse-Kunstleve. Extended for Unicode by Steven Knight.
SCons.dblite._exercise ()

class SCons.dblite.dblite (file_base_name, flag, mode)
Bases: object
Squirrel away references to the functions in various modules that we’ll use when our __del__() method calls our sync() method during shutdown. We might get destroyed when Python is in the midst of tearing down the different modules we import in an essentially arbitrary order, and some of the various modules’s global attributes may already be wiped out from under us.

See the discussion at:

_check_writable ()

__open (mode='r', buffering=- 1, encoding=None, errors=None, newline=None, closefd=True, opener=None)
Open file and return a stream. Raise OSError upon failure.
file is either a text or byte string giving the name (and the path if the file isn’t in the current working directory) of the file to be opened or an integer file descriptor of the file to be wrapped. (If a file descriptor is given, it is closed when the returned I/O object is closed, unless closefd is set to False.)
mode is an optional string that specifies the mode in which the file is opened. It defaults to ‘r’ which means open for reading in text mode. Other common values are ‘w’ for writing (truncating the file if it already exists), ‘x’ for creating and writing to a new file, and ‘a’ for appending (which on some Unix systems, means that all writes append to the end of the file regardless of the current seek position). In text mode, if encoding is not specified the encoding used is platform dependent: locale.getpreferredencoding(False) is called to get the current locale encoding. (For reading and writing raw bytes use binary mode and leave encoding unspecified.) The available modes are:

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘r’</td>
<td>open for reading (default)</td>
</tr>
<tr>
<td>‘w’</td>
<td>open for writing, truncating the file first</td>
</tr>
<tr>
<td>‘x’</td>
<td>create a new file and open it for writing</td>
</tr>
<tr>
<td>‘a’</td>
<td>open for writing, appending to the end of the file if it exists</td>
</tr>
<tr>
<td>‘b’</td>
<td>binary mode</td>
</tr>
<tr>
<td>‘t’</td>
<td>text mode (default)</td>
</tr>
<tr>
<td>‘r+’</td>
<td>open a disk file for updating (reading and writing)</td>
</tr>
<tr>
<td>‘U’</td>
<td>universal newline mode (deprecated)</td>
</tr>
</tbody>
</table>

The default mode is ‘rt’ (open for reading text). For binary random access, the mode ‘r+b’ opens and truncates the file to 0 bytes, while ‘r+b’ opens the file without truncation. The ‘x’ mode implies ‘w’ and raises an FileExistsError if the file already exists.

Python distinguishes between files opened in binary and text modes, even when the underlying operating system doesn’t. Files opened in binary mode (appending ‘b’ to the mode argument) return contents as bytes objects without any decoding. In text mode (the default, or when ‘t’ is appended to the mode argument), the contents of the file are returned as strings, the bytes having been first decoded using a platform-dependent encoding or using the specified encoding if given.
'U' mode is deprecated and will raise an exception in future versions of Python. It has no effect in Python 3. Use newline to control universal newlines mode.

Buffering is an optional integer used to set the buffering policy. Pass 0 to switch buffering off (only allowed in binary mode), 1 to select line buffering (only usable in text mode), and an integer > 1 to indicate the size of a fixed-size chunk buffer. When no buffering argument is given, the default buffering policy works as follows:

- Binary files are buffered in fixed-size chunks; the size of the buffer is chosen using a heuristic trying to determine the underlying device's “block size” and falling back on `io.DEFAULT_BUFFER_SIZE`. On many systems, the buffer will typically be 4096 or 8192 bytes long.
- “Interactive” text files (files for which `isatty()` returns True) use line buffering. Other text files use the policy described above for binary files.

Encoding is the name of the encoding used to decode or encode the file. This should only be used in text mode. The default encoding is platform dependent, but any encoding supported by Python can be passed. See the codecs module for the list of supported encodings.

Errors is an optional string that specifies how encoding errors are to be handled—this argument should not be used in binary mode. Pass 'strict' to raise a ValueError exception if there is an encoding error (the default of None has the same effect), or pass 'ignore' to ignore errors. (Note that ignoring encoding errors can lead to data loss.) See the documentation for codecs.register or run 'help(codecs.Codec)' for a list of the permitted encoding error strings.

Newline controls how universal newlines works (it only applies to text mode). It can be None, '', 'n', 'r', and 'rn'. It works as follows:

- On input, if newline is None, universal newlines mode is enabled. Lines in the input can end in 'n', 'r', or 'rn', and these are translated into 'n' before being returned to the caller. If it is '', universal newline mode is enabled, but line endings are returned to the caller untranslated. If it has any of the other legal values, input lines are only terminated by the given string, and the line ending is returned to the caller untranslated.
- On output, if newline is None, any 'n' characters written are translated to the system default line separator, os.linesep. If newline is '' or 'n', no translation takes place. If newline is any of the other legal values, any 'n' characters written are translated to the given string.

If closed is False, the underlying file descriptor will be kept open when the file is closed. This does not work when a file name is given and must be True in that case.

A custom opener can be used by passing a callable as opener. The underlying file descriptor for the file object is then obtained by calling opener with (file, flags). opener must return an open file descriptor (passing os.open as opener results in functionality similar to passing None).

open() returns a file object whose type depends on the mode, and through which the standard file operations such as reading and writing are performed. When open() is used to open a file in a text mode ('w', 'r', 'wt', 'rt', etc.), it returns a TextIOWrapper. When used to open a file in a binary mode, the returned class varies: in read binary mode, it returns a BufferedReader; in write binary and append binary modes, it returns a BufferedWriter, and in read/write mode, it returns a BufferedRandom.

It is also possible to use a string or bytearray as a file for both reading and writing. For strings StringIO can be used like a file opened in a text mode, and for bytes a BytesIO can be used like a file opened in a binary mode.

```python
_os_chmod (mode, *, dir_fd=None, follow_symlinks=True)
```

Change the access permissions of a file.

**path**
Path to be modified. May always be specified as a str, bytes, or a path-like object. On some platforms, path may also be specified as an open file descriptor. If this functionality is unavailable, using it raises an exception.

**mode**
Operating-system mode bitfield.

**dir_fd**
If not None, it should be a file descriptor open to a directory, and path should be relative; path will then be relative to that directory.

**follow_symlinks**
If False, and the last element of the path is a symbolic link, chmod will modify the symbolic link itself instead of the file the link points to.

*It is an error to use dir_fd or follow_symlinks when specifying path as*
an open file descriptor.

dir_fd and follow_symlinks may not be implemented on your platform.
If they are unavailable, using them will raise a NotImplementedError.

__os_chown__(uid, gid, *, dir_fd=None, follow_symlinks=True)
Change the owner and group id of path to the numeric uid and gid.

    path
    Path to be examined; can be string, bytes, a path-like object, or open-file-descriptor int.

    dir_fd
    If not None, it should be a file descriptor open to a directory, and path should be relative; path will then be relative to that directory.

    follow_symlinks
    If False, and the last element of the path is a symbolic link, stat will examine the symbolic link itself instead of the file the link points to.

path may always be specified as a string. On some platforms, path may also be specified as an open file descriptor.
If this functionality is unavailable, using it raises an exception.

If dir_fd is not None, it should be a file descriptor open to a directory, and path should be relative; path will then be relative to that directory.

If follow_symlinks is False, and the last element of the path is a symbolic link, chown will modify the symbolic link itself instead of the file the link points to.

It is an error to use dir_fd or follow_symlinks when specifying path as an open file descriptor.

dir_fd and follow_symlinks may not be implemented on your platform.
If they are unavailable, using them will raise a NotImplementedError.

__os_replace__(dst, *, src_dir_fd=None, dst_dir_fd=None)
Rename a file or directory, overwriting the destination.

If either src_dir_fd or dst_dir_fd is not None, it should be a file descriptor open to a directory, and the respective path string (src or dst) should be relative; the path will then be relative to that directory.

src_dir_fd and dst_dir_fd, may not be implemented on your platform.
If they are unavailable, using them will raise a NotImplementedError.

static__pickle_dump__(obj, file, protocol=None, *, fix_imports=True)
Write a pickled representation of obj to the open file object file.
This is equivalent to Pickler(file, protocol).dump(obj), but may be more efficient.
The optional protocol argument tells the pickler to use the given protocol supported protocols are 0, 1, 2, 3 and 4. The default protocol is 3; a backward-incompatible protocol designed for Python 3.
Specifying a negative protocol version selects the highest protocol version supported. The higher the protocol used, the more recent the version of Python needed to read the pickle produced.
The file argument must have a write() method that accepts a single bytes argument. It can thus be a file object opened for binary writing, an io.BytesIO instance, or any other custom object that meets this interface.
If fix_imports is True and protocol is less than 3, pickle will try to map the new Python 3 names to the old module names used in Python 2, so that the pickle data stream is readable with Python 2.

_pickle_protocol = 4

__shutil_copyfile__(dst, *, follow_symlinks=True)
Copy data from src to dst.
If follow_symlinks is not set and src is a symbolic link, a new symlink will be created instead of copying the file it points to.

time.time()
SCons.compat package

time() -> floating point number
   Return the current time in seconds since the Epoch. Fractions of a second may be present if the system clock
   provides them.

close()

keys()

sync()

SCons.dblite.open (file, flag=None, mode=438)

---

**SCons.exitfuncs module**

Register functions which are executed when SCons exits for any reason.

SCons.exitfuncs._run_exitfuncs ()
   run any registered exit functions

   _exithandlers is traversed in reverse order so functions are executed last in, first out.

SCons.exitfuncs.register (func, *targs, **kargs)
   register a function to be executed upon normal program termination

   func - function to be called at exit
   targs - optional arguments to pass to func
   kargs - optional keyword arguments to pass to func

---

**SCons.compat package**

---

**Module contents**

SCons compatibility package for old Python versions

This subpackage holds modules that provide backwards-compatible implementations of various things from newer
Python versions that we cannot count on because SCons still supported older Pythons.

Other code will not generally reference things in this package through the SCons.compat namespace. The modules
included here add things to the builtins namespace or the global module list so that the rest of our code can use the
objects and names imported here regardless of Python version. As a result, if this module is used, it should violate
the normal convention for imports (standard library imports first, then program-specific imports, each ordered
alphabetically) and needs to be listed first.

The rest of the things here will be in individual compatibility modules that are either: 1) suitably modified copies of the
future modules that we want to use; or 2) backwards compatible re-implementations of the specific portions of a
future module’s API that we want to use.

GENERAL WARNINGS: Implementations of functions in the SCons.compat modules are NOT guaranteed to be fully
compliant with these functions in later versions of Python. We are only concerned with adding functionality that we
actually use in SCons, so be wary if you lift this code for other uses. (That said, making these more nearly the same
as later, official versions is still a desirable goal, we just don’t need to be obsessive about it.)

We name the compatibility modules with an initial ’_scons_’ (for example, _scons_subprocess.py is our compatibility
module for subprocess) so that we can still try to import the real module name and fall back to our compatibility
module if we get an ImportError. The import_as() function defined below loads the module as the “real” name
(without the ‘_scons’), after which all of the “import {module}” statements in the rest of our code will find our
pre-loaded compatibility module.

class SCons.compat.NoSlotsPyPy (name, bases, dct)
   Bases: type
   Metaclass for PyPy compatibility.
   PyPy does not work well with __slots__ and __class__ assignment.

   mro ()
       Return a type’s method resolution order.

   SCons.compat.rename_module (new, old)
SCons.Node package

Attempt to import the old module and load it under the new name. Used for purely cosmetic name changes in Python 3.x.

**SCons.Node package**

**Submodules**

**SCons.Node.Alias module**

Alias nodes.

This creates a hash of global Aliases (dummy targets).

```python
class SCons.Node.Alias.Alias(name)

class Attrs
    Bases: object
        shared

BuildInfo

Decider (function)

GetTag (key)
    Return a user-defined tag.

NodeInfo

Tag (key, value)
    Add a user-defined tag.

_add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

.memo

_specific_sources

_tags
```
add_dependency (depend)
   Adds dependencies.

add_ignore (depend)
   Adds dependencies to ignore.

add_prerequisite (prerequisite)
   Adds prerequisites

add_source (source)
   Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
   Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don’t think you can “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
   Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
   Return a list of all the node’s direct children.

alter_targets ()
   Return a list of alternate targets for this Node.

always_build

attributes

binfo

build ()
   A “builder” for aliases.

builder

builder_set (builder)

built ()
   Called just after this node is successfully built.

cached

changed (node=None, allowcache=False)
   Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead. Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated. The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed(). @see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build
check_attributes (name)
    Simple API to check if the node.attributes for name has been set

children (scan=1)
    Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date ()
    Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was
    up-to-date, too.

clear ()
    Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous
    integration builds).

clear_memoized_values ()

convert ()

del_binfo ()
    Delete the build info from this node.

depends

depends_set

disambiguate (must_exist=None)

env

env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what.
    This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The
    purpose of this method is to generate a value to be used in signature calculation for the command line used to
    build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need
    to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
    does not change.

get_abspath ()
    Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a
    concept of relative path, this might return something different.

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
    the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
    built and updated by someone else, if that’s what’s wanted.
SCons.Node package

get_build_env()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig()

get_contents()
    The contents of an alias is the concatenation of the content signatures of all its sources.

get_csig()
    Generate a node's content signature, the digested signature of its content.
    node - the node cache - alternate node to use for the signature cache
    returns - the content signature

get_env()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
    scanned for implicit dependencies.

get_implicit_deps (env, initial_scanner, path_func, kw={})
    Return a list of implicit dependencies for this node.
    This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
    scanner, if the scanner’s recursive flag says that we should.

get_ninfo()

get_source_scanner (node)
    Fetch the source scanner for the specified node
    NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
    Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
    This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
    Fetch the stored implicit dependencies

get_stored_info()

get_string (for_signature)
    This is a convenience function designed primarily to be used in command generators (i.e.,
    CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
    argument that is nonzero if the command generator is being called to generate a signature for the command
    line, which determines if we should rebuild or not.
    Such command generators should use this method in preference to str(Node) when converting a Node to a
    string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
    depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()
This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a `__getattr__()` method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

```python
def get_suffix()

def get_target_scanner()

def has_builder() -> bool:
    Return whether this Node has a builder or not.
    In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: …"). When the builder attribute is examined directly, it ends up calling `__getattr__` for both the `__len__` and `__bool__` attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

def has_explicit_builder() -> bool:
    Return whether this Node has an explicit builder
    This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

def ignore()
    ignore_set

def implicit()
    implicit_set

def includes()

def is_conftest() -> bool:
    Returns true if this node is a conftest node

def is_derived() -> bool:
    Returns true if this node is derived (i.e. built).
    This should return true only for nodes whose path should be in the variant directory when `duplicate=0` and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

def is_explicit()

def is_literal() -> bool:
    Always pass the string representation of a Node to the command interpreter literally.

def is_sconscript() -> bool:
    Returns true if this node is an sconscript

def is_under(dir)

def is_up_to_date() -> bool:
    Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

def linked()

def make_ready() -> Node:
    Get a Node ready for evaluation.
```
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

new_binfo()

new_ninfo()

ninfo

nocache

noclean

postprocess()

Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()

Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)
Overriding this method allows for for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()

Try to push a node into a cache

really_build(**kw)

Actually build the node.
This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

ref_count

release_target_info()

Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()
SCons.Node package

remove ()
Remove this Node: no-op by default.

render_include_tree ()
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

reset_executor ()
Remove cached executor; forces recompute when needed.

retrieve_from_cache ()
Try to retrieve the node's content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists ()
Does this node exist locally or in a repository?

scan ()
Scan this node's dependents for implicit dependencies.

scanner_key ()
sconsign ()
An Alias is not recorded in .sconsign files

select_scanner (scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don't select one the Scanner.Selector that's configured for the target.

set_always_build (always_build=1)
Set the Node's always_build value.

set_executor (executor)
Set the action executor for this node.

set_explicit (is_explicit)

set_nocache (nocache=1)
Set the Node's nocache value.

set_noclean (noclean=1)
Set the Node's noclean value.

set_precious (precious=1)
Set the Node's precious value.

set_pseudo (pseudo=True)
Set the Node's precious value.

set_specific_source (source)

set_state (state)

side_effect

side_effects

sources
SCons.Node package

    sources_set
    state
    store_info
    str_for_display()
    target_peers
    visited()
        Called just after this node has been visited (with or without a build).
    waiting_parents
    waiting_s_e
    wkids

class SCons.Node.Alias.AliasBuildInfo
    Bases: SCons.Node.BuildInfoBase

    bact
    bactsig
    bdepends
    bdependsigs
    bimplicit
    bimplicitssigs
    bsources
    bsourcesigs
    current_version_id = 2

    merge (other)
        Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

class SCons.Node.Alias.AliasNameSpace (**kwargs)
    Bases: collections.UserDict

    Alias (name, **kw)

    _abc_impl = <_abc_data object>

    clear () → None. Remove all items from D.

    copy ()

    classmethod fromkeys (iterable, value=None)

    get (k [, d]) → D[k] if k in D, else d. d defaults to None.

    items () → a set-like object providing a view on D’s items

224
SCons.Node package

keys () → a set-like object providing a view on D’s keys

lookup (name, **kw)

pop (k[, d]) → v, remove specified key and return the corresponding value.
If key is not found, d is returned if given, otherwise KeyError is raised.

popitem () → (k, v), remove and return some (key, value) pair
as a 2-tuple; but raise KeyError if D is empty.

setdefault (k[, d]) → D.get(k,d), also set D[k]=d if k not in D

update ([, E], **F) → None. Update D from mapping/iterable E and F.
If E present and has a .keys() method, does: for k in E: D[k] = E[k] If E present and lacks .keys() method, does:
for (k, v) in E: D[k] = v In either case, this is followed by: for k, v in F.items(): D[k] = v

values () → an object providing a view on D’s values

convert (node, val)

csig

current_version_id = 2

field_list = ['csig']

format (field_list=None, names=0)

merge (other)
    Merge the fields of another object into this object. Already existing information is overwritten by the other
instance’s data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

str_to_node (s)

update (node)

SCons.Node.FS module

File system nodes.

These Nodes represent the canonical external objects that people think of when they think of building software: files
and directories.

This holds a “default_fs” variable that should be initialized with an FS that can be used by scripts or modules looking
for the canonical default.

class SCons.Node.FS.Base (name, directory, fs)

A generic class for file system entries. This class is for when we don’t know yet whether the entry being looked up
is a file or a directory. Instances of this class can morph into either Dir or File objects by a later, more precise
lookup.
Note: this class does not define __cmp__ and __hash__ for efficiency reasons. SCons does a lot of comparing of
Node.FS.{Base,Entry,File,Dir} objects, so those operations must be as fast as possible, which means we want to
use Python’s built-in object identity comparisons.

class Attrs
    Bases: object
SCons.Node package

shared

BuildInfo
   alias of `SCons.Node.BuildInfoBase`

Decider (function)

GetTag (key)
   Return a user-defined tag.

NodeInfo
   alias of `SCons.Node.NodeInfoBase`

RDirs (pathlist)
   Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
   Return all of the directories for a given path list, including corresponding “backing” directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)
   Add a user-defined tag.

_Rfindalldirs_key (pathlist)

_abspath

_add_child (collection, set, child)
   Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_sconsign

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_get_str ()

_glob1 (pattern, ondisk=True, source=False, strings=False)

_labspath

_local

_memo

_path
SCons.Node package

```python
_path_elements
_proxy
_save_str()
_specific_sources
_tags
_tpath

add_dependency(depend)
    Adds dependencies.

add_ignore(depend)
    Adds dependencies to ignore.

add_prerequisite(prerequisite)
    Adds prerequisites

add_source(source)
    Adds sources.

add_to_implicit(deps)

add_to_waiting_parents(node)
    Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
    (Note that the returned values are intended to be used to increment a reference count, so don't think you can
    "clean up" this function by using True and False instead...)

add_to_waiting_s_e(node)

add_wkid(wkid)
    Add a node to the list of kids waiting to be evaluated

all_children(scan=1)
    Return a list of all the node's direct children.

alter_targets()
    Return a list of alternate targets for this Node.

always_build

attributes

binfo

build(**kw)
    Actually build the node.
    This is called by the Taskmaster after it's decided that the Node is out-of-date and must be rebuilt, and after the
    prepare() method has gotten everything, uh, prepared.
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
    unsafe stuff in built().

builder

builder_set(builder)

built()
    Called just after this node is successfully built.
```
cached

changed (node=None, allowcache=False)
Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build

check_attributes (name)
Simple API to check if the node.attributes for name has been set

children (scan=1)
Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date ()
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

clear ()
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

clear_memoized_values ()

cwd

del_binfo ()
Delete the build info from this node.

eval

executor

executor_cleanup ()
Let the executor clean up any cached information.

exists ()
Does this node exists?

explain ()
for_signature()
Return a string representation of the Node that will always be the same for this particular Node, no matter what.
This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs
Reference to parent Node.FS object

get_abspath()
Get the absolute path of the file.

get_binfo()
Fetch a node's build information.
node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
This no longer handles the recursive descent of the node’s children's signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env()
Fetch the appropriate Environment to build this node.

get_build_scanner_path(scanner)
Fetch the appropriate scanner path for this node.

get_builder(default_builder=None)
Return the set builder, or a specified default value

get_cachedir_csig()

get_contents()
Fetch the contents of the entry.

get_csig()

get_dir()

get_env()

get_env_scanner(env, kw={})

get_executor(create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes(env, scanner, path)
Return the scanned include lines (implicit dependencies) found in this node.
The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be scanned for implicit dependencies.

get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

get_internal_path()

get_labspath()
Get the absolute path of the file.
get_ninfo ()

get_path (dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements ()

get_relpth ()
Get the path of the file relative to the root SConstruct file’s directory.

get_source_scanner (node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
This is a convenience function designed primarily to be used in command generators (i.e.,
CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy ()
This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix ()

get_target_scanner ()

get_tpath ()

getmtime ()

getsize ()

has_builder ()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder ()
Return whether this Node has an explicit builder
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).
ignore
ignore_set

implicit
implicit_set

includes

is_conftest()
Returns true if this node is a conftest node

is Derived()
Returns true if this node is derived (i.e., build).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and
should contribute their build signatures when they are used as source files to other derived files. For example:
source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()
Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()
Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will
always get built.

isdir()
isfile()
islink()
linked

lstat()

make_ready()
Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a
Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if
node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

must_be_same(klass)
This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.

name
Clean up anything we don’t need to hang onto after we’ve been built.

Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)
Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires...as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()

Remove this Node: no-op by default.

Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

Remove cached executor; forces recompute when needed.

Try to retrieve the node’s content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.
Does this node exist locally or in a repository?

`rfile()`

`rstr()`

A Node.FS.Base object's string representation is its path name.

`sbuilder`

`scan()`

Scan this node's dependents for implicit dependencies.

`scanner_key()`

`select.Scanner (scanner)`

Selects a scanner for this Node. This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don't select one the Scanner.Selector that's configured for the target.

`set.always_build (always_build=1)`

Set the Node's always_build value.

`set.executor (executor)`

Set the action executor for this node.

`set.explicit (is_explicit)`

`set.local()`

`set.nocache (nocache=1)`

Set the Node's nocache value.

`set.noclean (noclean=1)`

Set the Node's noclean value.

`set.precious (precious=1)`

Set the Node's precious value.

`set.pseudo (pseudo=True)`

Set the Node's precious value.

`set_specific_source (source)`

`set.src.builder (builder)`

Set the source code builder for this node.

`set.state (state)`

`side_effect`

`side_effects`

`sources`

`sources_set`

`src.builder()`

Fetch the source code builder for this node. If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).
srcnode()
    If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.

stat()

state

store_info

str_for_display()

target_from_source(prefix, suffix, splitext=<function splitext>)
    Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix.
    Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

target_peers

visited()
    Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

wkids

class SCons.Node.FS.Dir (name, directory, fs)
    Bases: SCons.Node.FS.Base
    A class for directories in a file system.

class Attrs
    Bases: object

    shared

BuildInfo
    alias of SCons.Node.FS.DirBuildInfo

Decider (function)

Dir (name, create=True)
    Looks up or creates a directory node named ‘name’ relative to this directory.

Entry (name)
    Looks up or creates an entry node named ‘name’ relative to this directory.

File (name)
    Looks up or creates a file node named ‘name’ relative to this directory.

GetTag (key)
    Return a user-defined tag.

NodeInfo
    alias of SCons.Node.FS.DirNodeInfo

RDirs (pathlist)
    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
    Return all of the directories for a given path list, including corresponding “backing” directories in any repositories.
The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

**Tag** (key, value)
Add a user-defined tag.

___Rfindalldirs_key (pathlist)

___clearRepositoryCache (duplicate=None)
Called when we change the repository(ies) for a directory. This clears any cached information that is invalidated by changing the repository.

___resetDuplicate (node)

абspath

_add_child (collection, set, child)
Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_create ()
Create this directory, silently and without worrying about whether the builder is the default or not.

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_sconsign

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_get_str ()

_glob1 (pattern, ondisk=True, source=False, strings=False)
Globs for and returns a list of entry names matching a single pattern in this directory. This searches any repositories and source directories for corresponding entries and returns a Node (or string) relative to the current directory if an entry is found anywhere.

TODO: handle pattern with no wildcard

_abspath

_local

_memo

_morph ()
Turn a file system Node (either a freshly initialized directory object or a separate Entry object) into a proper directory object.
Set up this directory’s entries and hook it into the file system tree. Specify that directories (this Node) don’t use signatures for calculating whether they’re current.

do_duplicate(src)

duplicate

entries

entry_abspath(name)

entry_exists_on_disk(name)
  Searches through the file/dir entries of the current directory, and returns True if a physical entry with the given
  name could be found.
  @see entry_exists_on_disk

entry_labspath(name)

entry_path(name)

entry_tpath(name)

env

env_set(env, safe=0)

executor

executor_cleanup()
  Let the executor clean up any cached information.

exists()
  Does this node exists?

explain()

file_on_disk(name)

for_signature()
  Return a string representation of the Node that will always be the same for this particular Node, no matter what.
  This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The
  purpose of this method is to generate a value to be used in signature calculation for the command line used to
  build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need
  to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
  does not change.

fs

getRepositories()
  Returns a list of repositories for this directory.

get_abspath()
  Get the absolute path of the file.

get_all_rdirs()

get_binfo()
  Fetch a node's build information.
  node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
  the build signature
  This no longer handles the recursive descent of the node's children's signatures. We expect that they're already
  built and updated by someone else, if that's what's wanted.

238
SCons.Node package

get_build_env()
Fetch the appropriate Environment to build this node.

get_build_scanner_path(scanner)
Fetch the appropriate scanner path for this node.

get_builder(default_builder=None)
Return the set builder, or a specified default value

get_cachedir_csig()

get_contents()
Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are sorted.

get_csig()
Compute the content signature for Directory nodes. In general, this is not needed and the content signature is not stored in the DirNodeInfo. However, if get_contents on a Dir node is called which has a child directory, the child directory should return the hash of its contents.

get_dir()

get_env()

get_env_scanner(env, kw={})

get_executor(create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes(env, scanner, path)
Return this directory’s implicit dependencies. We don’t bother caching the results because the scan typically shouldn’t be requested more than once (as opposed to scanning .h file contents, which can be requested as many times as the files is #included by other files).

get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node. This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

get_internal_path()

get_labspath()
Get the absolute path of the file.

get_ninfo()

get_path(dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements()

get_relpath()
Get the path of the file relative to the root SConstruct file’s directory.

get_source_scanner(node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner. Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified. This function may be called very often; it attempts to cache the scanner found to improve performance.
SCons.Node package

get_state()

get_stored_implicit()
    Fetch the stored implicit dependencies

get_stored_info()

get_string(for_signature)
    This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.
    Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()
    This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

get_text_contents()
    We already emit things in text, so just return the binary version.

get_timestamp()
    Return the latest timestamp from among our children

get_tpath()

getmtime()

getsize()

glob(pathname, ondisk=True, source=False, strings=False, exclude=None)
    Returns a list of Nodes (or strings) matching a specified pathname pattern.
    Pathname patterns follow UNIX shell semantics: * matches any-length strings of any characters, ? matches any character, and [] can enclose lists or ranges of characters. Matches do not span directory separators.
    The matches take into account Repositories, returning local Nodes if a corresponding entry exists in a Repository (either an in-memory Node or something on disk).
    By default, the glob() function matches entries that exist on-disk, in addition to in-memory Nodes. Setting the “ondisk” argument to False (or some other non-true value) causes the glob() function to only match in-memory Nodes. The default behavior is to return both the on-disk and in-memory Nodes.
    The “source” argument, when true, specifies that corresponding source Nodes must be returned if you’re globbing in a build directory (initialized with VariantDir()). The default behavior is to return Nodes local to the VariantDir().
    The “strings” argument, when true, returns the matches as strings, not Nodes. The strings are path names relative to this directory.
    The “exclude” argument, when true, returns the matches as strings, not Nodes. The strings are path names relative to this directory.
    The “exclude” argument, if not None, must be a pattern or a list of patterns following the same UNIX shell semantics. Elements matching a least one pattern of this list will be excluded from the result.
    The underlying algorithm is adapted from the glob.glob() function in the Python library (but heavily modified), and uses fnmatch() under the covers.

has_builder()
    Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a *lot* more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

**has_explicit_builder()**

Return whether this Node has an explicit builder

This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

**ignore**

**ignore_set**

**implicit**

**implicit_set**

**includes**

**is_conftest()**

Returns true if this node is a conftest node

**is-derived()**

Returns true if this node is derived (i.e. built).

This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

**is_explicit**

**is_literal()**

Always pass the string representation of a Node to the command interpreter literally.

**is_sconscript()**

Returns true if this node is an sconscript

**is_under(dir)**

**is_up_to_date()**

If any child is not up-to-date, then this directory isn’t, either.

**isdir()**

**isfile()**

**islink()**

**link(srcdir, duplicate)**

Set this directory as the variant directory for the supplied source directory.

**linked**

**lstat()**

**make_ready()**

Get a Node ready for evaluation.

This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

**missing()**
multiple_side_effect_has_builder()

Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

must_be_same(klass)

This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.

name

new_binfo()

new_ninfo()

ninfo

cache

cleancache

on_disk_entries

postprocess()

Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()

Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)
Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()

Try to push a node into a cache

rdir()

ref_count

rel_path(other)

Return a path to “other” relative to this directory.

release_target_info()

Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()
SCons.Node package

released_target_info
remove()  
Remove this Node: no-op by default.

render_include_tree()  
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

rentry()  

rentry_exists_on_disk(name)  
Searches through the file/dir entries of the current and all its remote directories (repos), and returns True if a physical entry with the given name could be found. The local directory (self) gets searched first, so repositories take a lower precedence regarding the searching order.  
@see entry_exists_on_disk

repositories
reset_executor()  
Remove cached executor; forces recompute when needed.

retrieve_from_cache()  
Try to retrieve the node’s content from a cache  
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().  
Returns true if the node was successfully retrieved.

rexists()  
Does this node exist locally or in a repository?

rfile()

root

rstr()  
A Node.FS.Base object’s string representation is its path name.

sbuilder
scan()  
Scan this node’s dependents for implicit dependencies.

scanner_key()  
A directory does not get scanned.

scanner_paths
sconsign()  
Return the .sconsign file info for this directory.

searched
select_scanner(scanner)  
Selects a scanner for this Node.  
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build(always_build=1)  
Set the Node’s always_build value.

set_executor(executor)
SCons.Node package

Set the action executor for this node.

```python
set_explicit (is_explicit)
```

```python
set_local ()
```

```python
set_nocache (nocache=1)
Set the Node's nocache value.
```

```python
set_noclean (noclean=1)
Set the Node’s noclean value.
```

```python
set_precious (precious=1)
Set the Node’s precious value.
```

```python
set_pseudo (pseudo=True)
Set the Node’s precious value.
```

```python
set_specific_source (source)
```

```python
set_src_builder (builder)
Set the source code builder for this node.
```

```python
set_state (state)
```

```python
side_effect
```

```python
side_effects
```

```python
sources
```

```python
sources_set
```

```python
src_builder ()
Fetch the source code builder for this node.
If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value
from its parent directory, and so on up to the file system root).
```

```python
srcdir
```

```python
srcdir_duplicate (name)
```

```python
srcdir_find_file (filename)
```

```python
srcdir_list ()
```

```python
srcnode ()
Dir has a special need for srcnode()...if we have a srcdir attribute set, then that is our srcnode.
```

```python
stat ()
```

```python
state
```

```python
store_info
```

```python
str_for_display ()
```

```python
target_from_source (prefix, suffix, splitext=<function splitext>)
Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix.
Note that this method can be overridden dynamically for generated files that need different behavior. See
Tool/swig.py for an example.
```
SCons.Node package

target_peers

up ()

variant_dirs

visited ()
   Called just after this node has been visited (with or without a build).

waiting_parents

waiting_s_e

walk (func, arg)
   Walk this directory tree by calling the specified function for each directory in the tree.
   This behaves like the os.path.walk() function, but for in-memory Node.FS.Dir objects. The function takes the
   same arguments as the functions passed to os.path.walk():
      
      func(arg, dirname, fnames)
   Except that "dirname" will actually be the directory Node, not the string. The '.', and '..' entries are excluded from
   fnames. The fnames list may be modified in-place to filter the subdirectories visited or otherwise impose a
   specific order. The "arg" argument is always passed to func() and may be used in any way (or ignored, passing
   None is common).

update (node)

class SCons.Node.FS.DiskChecker (type, do, ignore)
Bases: object

set (list)

class SCons.Node.FS.Entry (name, directory, fs)
Bases: SCons.Node.FS.Base
This is the class for generic Node.FS entries—that is, things that could be a File or a Dir, but we’re just not sure yet. Consequently, the methods in this class really exist just to transform their associated object into the right class when the time comes, and then call the same-named method in the transformed class.

class Attrs
Bases: object

shared

BuildInfo
alias of SCons.Node.BuildInfoBase

Decider (function)

GetTag (key)
Return a user-defined tag.

NodeInfo
alias of SCons.Node.NodeInfoBase

RDirs (pathlist)
Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
Return all of the directories for a given path list, including corresponding “backing” directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)
Add a user-defined tag.

_Rfindalldirs_key (pathlist)

__abspath

__add_child (collection, set, child)
Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

__children_get ()

__children_reset ()

__func_exists

__func_get_contents
SCons.Node package

_get_scanner (env, initial_scanner, root_node_scanner, kw)
_get_str ()
_glob1 (pattern, ondisk=True, source=False, strings=False)
_labspath
_local
_mem
_path
_path_elements
_proxy
_save_str ()
_sconsign
_specific_sources
_tags
_tpath

add_dependency (depend)
   Adds dependencies.

add_ignore (depend)
   Adds dependencies to ignore.

add_prerequisite (prerequisite)
   Adds prerequisites.

add_source (source)
   Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
   Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
   (Note that the returned values are intended to be used to increment a reference count, so don’t think you can
   “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
   Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
Return a list of all the node’s direct children.

**alter_targets()**

Return a list of alternate targets for this Node.

**always_build**

**attributes**

**binfo**

**build(****kw**)**

Actually build the node.
This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

**builder**

**builder_set**( builder )

**built()**

Called just after this node is successfully built.

**cached**

**cachedir_csig**

**cachesig**

**changed**( node=None, allowcache=False )

Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

**changed_since_last_build**

**check_attributes**( name )

Simple API to check if the node.attributes for name has been set

**children**( scan=1 )

Return a list of the node’s direct children, minus those that are ignored by this node.

**children_are_up_to_date()**

Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

**clear()**

Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

**clear_memoized_values()**
SCons.Node package

contentsig
cwd
del_binfo ()
   Delete the build info from this node.
depends
depends_set
dir
dirname
disambiguate (must_exist=None)
diskcheck_match ()
duplicate
targets
target_set (env, safe=0)
executor
executor_cleanup ()
   Let the executor clean up any cached information.
exists ()
   Does this node exists?
explain ()
for_signature ()
   Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs
get_abspath ()
   Get the absolute path of the file.
get_binfo ()
   Fetch a node's build information.
   node - the node whose sources will be collected cache - alternate node to use for the signature cache returns -
   the build signature
   This no longer handles the recursive descent of the node's children's signatures. We expect that they're already
   built and updated by someone else, if that's what's wanted.
get_build_env ()
   Fetch the appropriate Environment to build this node.
get_build_scanner_path (scanner)
Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Fetch the contents of the entry. Returns the exact binary contents of the file.

get_csig ()

get_dir ()

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
    scanned for implicit dependencies.

get_implicit_deps (env, initial_scanner, path_func, kw={})
    Return a list of implicit dependencies for this node.
    This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
    scanner, if the scanner’s recursive flag says that we should.

get_internal_path ()

get_labspath ()
    Get the absolute path of the file.

get_ninfo ()

get_path (dir=None)
    Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements ()

get_relpath ()
    Get the path of the file relative to the root SConstruct file’s directory.

get_source_scanner (node)
    Fetch the source scanner for the specified node
    NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
    Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
    This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
    Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.

Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()

This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

get_text_contents()

Fetch the decoded text contents of a Unicode encoded Entry. Since this should return the text contents from the file system, we check to see into what sort of subclass we should morph this Entry.

get_tpath()

gmtime()

getsize()

has_builder()

Return whether this Node has a builder or not. In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder()

Return whether this Node has an explicit builder. This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes

is_conftest()

Returns true if this node is a conftest node.

is-derived()

Returns true if this node is derived (i.e. built). This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.
SCons.Node package

is_explicit

is_literal()

Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()

Returns true if this node is an sconscript

is_under(dir)

is_up_to_date()

Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will always get built.

isdir()

isfile()

islink()

linked

lstat()

make_ready()

Get a Node ready for evaluation.

This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

must_be_same(klass)

Called to make sure a Node is a Dir. Since we’re an Entry, we can morph into one.

name

new_binfo()

new_ninfo()

ninfo

nocache

noclean

on_disk_entries

postprocess()

Clean up anything we don’t need to hang onto after we’ve been built.

prepare()
Prepare for this Node to be built. This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node. This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built. (The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.) Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

```plaintext
prerequisites

pseudo

push_to_cache ()
Try to push a node into a cache

ref_count

rel_path (other)

release_target_info ()
Called just after this node has been marked up-to-date or was built completely. This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption. By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards. @see: built() and File.release_target_info()

released_target_info

remove ()
Remove this Node: no-op by default.

render_include_tree ()
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

rentry ()

repositories

reset_executor ()
Remove cached executor; forces recompute when needed.

retrieve_from_cache ()
Try to retrieve the node’s content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists ()
Does this node exist locally or in a repository?

rfile ()
We’re a generic Entry, but the caller is actually looking for a File at this point, so morph into one.

root

rstr ()
A Node.FS.Base object’s string representation is its path name.
```
sbuilder

scan ()
    Scan this node’s dependents for implicit dependencies.

scanner_key ()

scanner_paths

searched

select_scanner (scanner)
    Selects a scanner for this Node.
    This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use
    their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build (always_build=1)
    Set the Node’s always_build value.

set_executor (executor)
    Set the action executor for this node.

set_explicit (is_explicit)

set_local ()

set_nocache (nocache=1)
    Set the Node’s nocache value.

set_noclean (noclean=1)
    Set the Node’s noclean value.

set_precious (precious=1)
    Set the Node’s precious value.

set_pseudo (pseudo=True)
    Set the Node’s precious value.

set_specific_source (source)

set_src_builder (builder)
    Set the source code builder for this node.

set_state (state)

side_effect

side_effects

sources

sources_set

src_builder ()
    Fetch the source code builder for this node.
    If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value
    from its parent directory, and so on up to the file system root).

srcdir

srcnode ()
If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.

\texttt{stat ()}
\texttt{state}
\texttt{store\_info}
\texttt{str\_for\_display ()}

\texttt{target\_from\_source (prefix, suffix, splitext=<\texttt{function splitext}>)}
Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix. Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

\texttt{target\_peers}
\texttt{variant\_dirs}
\texttt{visited ()}
Called just after this node has been visited (with or without a build).
\texttt{waiting\_parents}
\texttt{waiting\_s\_e}
\texttt{wkids}

class \texttt{SCons.Node.FS.EntryProxy (subject)}
Bases: \texttt{SCons.Util.Proxy}

\texttt{__get\_abspath ()}
\texttt{__get\_base\_path ()}
Return the file’s directory and file name, with the suffix stripped.
\texttt{__get\_dir ()}
\texttt{__get\_file ()}
\texttt{__get\_filebase ()}
\texttt{__get\_posix\_path ()}
Return the path with / as the path separator, regardless of platform.
\texttt{__get\_relpath ()}
\texttt{__get\_rsrc\_dir ()}
Returns the directory containing the source node linked to this node via VariantDir(), or the directory of this node if not linked.
\texttt{__get\_rsrc\_node ()}
\texttt{__get\_s\_rcdir ()}
Returns the directory containing the source node linked to this node via VariantDir(), or the directory of this node if not linked.
\texttt{__get\_s\_r\_cnode ()}
\texttt{__get\_suffix ()}
__get_windows_path ()
Return the path with as the path separator, regardless of platform.

dictSpecialAttrs = {'abspath': <function EntryProxy.__get_abspath>, 'base': <function EntryProxy.__get_base_path>, 'dir': <function EntryProxy.__get_dir>, 'file': <function EntryProxy.__get_file>, 'filebase': <function EntryProxy.__get_filebase>, 'posix': <function EntryProxy.__get_posix_path>, 'relpath': <function EntryProxy.__get_relpath>, 'rsrcrelpath': <function EntryProxy.__get_rsrcnode>, 'rsrcrelbase': <function EntryProxy.__get_rsrcnode>, 'rsrcrelpath': <function EntryProxy.__get_rsrcnode>, 'rsrcrelfilebase': <function EntryProxy.__get_rsrcnode>, 'rsrcrelsource': <function EntryProxy.__get_rsrcnode>, 'rsrcrelwindows': <function EntryProxy.__get_rsrcnode>, 'windows': <function EntryProxy.__get_windows_path>}

def get ()
Retrieves the entire wrapped object

exception SCons.Node.FS.EntryProxyAttributeError (entry_proxy, attribute)
Bases: AttributeError
An AttributeError subclass for recording and displaying the name of the underlying Entry involved in an AttributeError exception.

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

class SCons.Node.FS.FS (path=None)
Bases: SCons.Node.FS.LocalFS

Dir (name, directory=None, create=True)
Look up or create a Dir node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.
This method will raise TypeError if a normal file is found at the specified path.

Entry (name, directory=None, create=1)
Look up or create a generic Entry node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.

File (name, directory=None, create=1)
Look up or create a File node with the specified name. If the name is a relative path (begins with ./, ../, or a file name), then it is looked up relative to the supplied directory node, or to the top level directory of the FS (supplied at construction time) if no directory is supplied.
This method will raise TypeError if a directory is found at the specified path.

Glob (pathname, ondisk=True, source=True, strings=False, exclude=None, cwd=None)
Globs
This is mainly a shim layer

PyPackageDir (modulename)
Locate the directory of a given python module name
For example scons might resolve to Windows: C:Python27Libsite-packages\scons-2.5.1 Linux: /usr/lib/scons
This can be useful when we want to determine a toolpath based on a python module name

Repository ("dirs")
Specify Repository directories to search.

VariantDir (variant_dir, src_dir, duplicate=1)
Link the supplied variant directory to the source directory for purposes of building files.

__lookup (p, directory, fsclass, create=1)
The generic entry point for Node lookup with user-supplied data.
This translates arbitrary input into a canonical Node.FS object of the specified fsclass. The general approach for strings is to turn it into a fully normalized absolute path and then call the root directory’s lookup_abs() method for the heavy lifting.

If the path name begins with ‘#’, it is unconditionally interpreted relative to the top-level directory of this FS. ‘#’ is treated as a synonym for the top-level SConstruct directory, much like ‘~’ is treated as a synonym for the user’s home directory in a UNIX shell. So both ‘#foo’ and ‘#/foo’ refer to the ‘foo’ subdirectory underneath the top-level SConstruct directory.

If the path name is relative, then the path is looked up relative to the specified directory, or the current directory (self._cwd, typically the SConscript directory) if the specified directory is None.

\[\text{chdir} \text{(dir, change_os_dir=0)}\]
Change the current working directory for lookups. If change_os_dir is true, we will also change the “real” cwd to match.

\[\text{chmod} \text{(path, mode)}\]

\[\text{copy} \text{(src, dst)}\]

\[\text{copy2} \text{(src, dst)}\]

\[\text{exists} \text{(path)}\]

\[\text{get\_max\_drift} ()\]

\[\text{get\_root} \text{(drive)}\]
Returns the root directory for the specified drive, creating it if necessary.

\[\text{getcwd} ()\]

\[\text{getmtime} \text{(path)}\]

\[\text{getsize} \text{(path)}\]

\[\text{isdir} \text{(path)}\]

\[\text{isfile} \text{(path)}\]

\[\text{islink} \text{(path)}\]

\[\text{link} \text{(src, dst)}\]

\[\text{listdir} \text{(path)}\]

\[\text{lstat} \text{(path)}\]

\[\text{makedirs} \text{(path, mode=511, exist_ok=False)}\]

\[\text{mkdir} \text{(path, mode=511)}\]

\[\text{open} \text{(path)}\]

\[\text{readlink} \text{(file)}\]

\[\text{rename} \text{(old, new)}\]

\[\text{scandir} \text{(path)}\]

\[\text{set\_SConstruct\_dir} \text{(dir)}\]

\[\text{set\_max\_drift} \text{(max\_drift)}\]
SCons.Node package

stat (path)
symlink (src, dst)
unlink (path)

variant_dir_target_climb (orig, dir, tail)
    Create targets in corresponding variant directories
    Climb the directory tree, and look up path names relative to any linked variant directories we find.
    Even though this loops and walks up the tree, we don’t memoize the return value because this is really only
    used to process the command-line targets.

class SCons.Node.FS.File (name, directory, fs)
    Bases: SCons.Node.FS.Base
    A class for files in a file system.

class Attrs
    Bases: object

    shared

BuildInfo
    alias of SCons.Node.FS.FileBuildInfo

Decider (function)

Dir (name, create=True)
    Create a directory node named ‘name’ relative to the directory of this file.

Dirs (pathlist)
    Create a list of directories relative to the SConscript directory of this file.

Entry (name)
    Create an entry node named ‘name’ relative to the directory of this file.

File (name)
    Create a file node named ‘name’ relative to the directory of this file.

GetTag (key)
    Return a user-defined tag.

NodeInfo
    alias of SCons.Node.FS.FileNodeInfo

RDirs (pathlist)
    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)
    Return all of the directories for a given path list, including corresponding “backing” directories in any repositories.
    The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking
    up the same path for each target in a given directory.

Tag (key, value)
    Add a user-defined tag.

_Rfindalldirs_key (pathlist)

__dmap_cache = {}

__dmap_sig_cache = {}
SCons.Node package

___abspath___

___add_child___ (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

___add_strings_to_dependency_map___ (dmap)
    In the case comparing node objects isn’t sufficient, we’ll add the strings for the nodes to the dependency map

:return:

___build_dependency_map___ (binfo)
    Build mapping from file -> signature

Parameters:
    • - self (self) –
    • - buildinfo from node being considered (binfo) –

Returns: dictionary of file->signature mappings

___children_get___ ()

___children_reset___ ()

___createDir___ ()

___func_exists___

___func_get_contents___

___func_is_derived___

___func_rexists___

___func_sconsign___

___func_target_from_source___

___get_found_includes_key___ (env, scanner, path)

___get_previous_signatures___ (dmap)
    Return a list of corresponding csigs from previous build in order of the node/files in children.

Parameters:  
    • - self (self) –
    • - Dictionary of file -> csig (dmap) –

Returns: List of csigs for provided list of children

___get_scanner___ (env, initial_scanner, root_node_scanner, kw)

___get_str___ ()

___glob1___ (pattern, ondisk=True, source=False, strings=False)

___labspath___

___local___

___memo___

___morph___ ()
    Turn a file system node into a File object.

___path___
SCons.Node package

_path_elements  
_proxy  
_rmv_existing()  
_save_str()  
_sconsign  
_specific_sources  
_tags  
_tpath  

add_dependency(depend)  
  Adds dependencies.

add_ignore(depend)  
  Adds dependencies to ignore.

add_prerequisite(prerequisite)  
  Adds prerequisites.

add_source(source)  
  Adds sources.

add_to_implicit(deps)  

add_to_waiting_parents(node)  
  Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.  
  (Note that the returned values are intended to be used to increment a reference count, so don’t think you can  
  “clean up” this function by using True and False instead…)

add_to_waiting_s_e(node)  

add_wkid(wkid)  
  Add a node to the list of kids waiting to be evaluated.

all_children(scan=1)  
  Return a list of all the node’s direct children.

alter_targets()  
  Return any corresponding targets in a variant directory.

always_build  

attributes  

binfo  

build(**kw)  
  Actually build the node.  
  This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the  
  prepare() method has gotten everything, uh, prepared.  
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread  
  unsafe stuff in built().

builder
builder_set (builder)

built ()
   Called just after this File node is successfully built.
   Just like for ‘release_target_info’ we try to release some more target node attributes in order to minimize the
   overall memory consumption.
   @see: release_target_info

cached

cachedir_csig

cachesig

changed (node=None, allowcache=False)
   Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built.
   For File nodes this is basically a wrapper around Node.changed(), but we allow the return value to get cached
   after the reference to the Executor got released in release_target_info().
   @see: Node.changed()

changed_content (target, prev_ni, repo_node=None)

changed_since_last_build

changed_state (target, prev_ni, repo_node=None)

changed_timestamp_match (target, prev_ni, repo_node=None)
   Return True if the timestamps don’t match or if there is no previous timestamp.
   @param target: 
   @param prev_ni: Information about the node from the previous build.

changed_timestamp_newer (target, prev_ni, repo_node=None)

changed_timestamp_then_content (target, prev_ni, node=None)
   Used when decider for file is Timestamp-MD5
   NOTE: If the timestamp hasn’t changed this will skip md5’ing the
   file and just copy the prev_ni provided. If the prev_ni is wrong. It will propagate it. See:
   https://github.com/SCons/scons/issues/2980

   Parameters:
   - dependency (self) –
   - target (target) –
   - The NodeInfo object loaded from previous builds .sconsign (prev_ni) –
   - Node instance. Check this node for file existence/timestamp (node) – if specified.

   Returns: Boolean - Indicates if node(File) has changed.

check_attributes (name)
   Simple API to check if the node.attributes for name has been set

children (scan=1)
   Return a list of the node’s direct children, minus those that are ignored by this node.

children_are_up_to_date ()
   Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was
   up-to-date, too.

clear ()
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

```python
clear_memoized_values()
```

```python
contentsig
```

```python
convert_copy_attrs = ['bsources', 'bimplicit', 'bdepends', 'bact', 'bactsig', 'ninfo']
```

```python
convert_old_entry(old_entry)
```

```python
convert_sig_attrs = ['bsourcesigs', 'bimplicitsigs', 'bdependsig']
```

```python
cwd
```

```python
del_binfo()
Delete the build info from this node.
```

depends
depends_set
dir
dirname
disambiguate(must_exist=None)
diskcheck_match()
do_duplicate(src)
duplicate
entries
env
env_set(env, safe=0)
executor
executor_cleanup()
Let the executor clean up any cached information.
exists()
Does this node exists?
explain()
find_repo_file()
For this node, find if there exists a corresponding file in one or more repositories: return: list of corresponding files in repositories
find_src_builder()
for_signature()
Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the `__str__()` method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of `str()` to avoid unnecessary rebuilds. This method does not need
to return something that would actually work in a command line; it can return any kind of nonsense, so long as it
does not change.

\texttt{fs}

\texttt{get_abspath ()}
Get the absolute path of the file.

\texttt{get_binfo ()}
Fetch a node's build information.
\texttt{name}  - the node whose sources will be collected
\texttt{cache}  - alternate node to use for the signature cache
\texttt{returns}  - the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already
built and updated by someone else, if that’s what’s wanted.

\texttt{get_build_env ()}
Fetch the appropriate Environment to build this node.

\texttt{get_build_scanner_path (scanner)}
Fetch the appropriate scanner path for this node.

\texttt{get_builder (default_builder=None)}
Return the set builder, or a specified default value

\texttt{get_cachedir_bsig ()}
Return the signature for a cached file, including its children.
It adds the path of the cached file to the cache signature, because multiple targets built by the same action will
all have the same build signature, and we have to differentiate them somehow.
Signature should normally be string of hex digits.

\texttt{get_cachedir_csig ()}
Fetch a Node’s content signature for purposes of computing another Node’s cachesig.
This is a wrapper around the normal get_csig() method that handles the somewhat obscure case of using
CacheDir with the -n option. Any files that don’t exist would normally be “built” by fetching them from the cache,
but the normal get_csig() method will try to open up the local file, which doesn’t exist because the -n option
meant we didn’t actually pull the file from cachedir. But since the file \texttt{does} actually exist in the cachedir, we can
use its contents for the csig.

\texttt{get_content_hash ()}  $\rightarrow$  \texttt{str}
Compute and return the hash for this file.

\texttt{get_contents ()}  $\rightarrow$  \texttt{bytes}
Return the contents of the file as bytes.

\texttt{get_contents_sig ()}
A helper method for get_cachedir_bsig.
It computes and returns the signature for this node’s contents.

\texttt{get_csig ()}  $\rightarrow$  \texttt{str}
Generate a node’s content signature.

\texttt{get_dir ()}

\texttt{get_env ()}

\texttt{get_env_scanner (env, kw={})}

\texttt{get_executor (create=1)}
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

\texttt{get_found_includes (env, scanner, path)}
Return the included implicit dependencies in this file. Cache results so we only scan the file once per path regardless of how many times this information is requested.

```python
get_implicit_deps(env, initial_scanner, path_func, kw={})
```

Return a list of implicit dependencies for this node. This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

```python
get_internal_path()
```

```python
get_labspath()
```

Get the absolute path of the file.

```python
get_max_drift_csigt → Optional[str]
```

Returns the content signature currently stored for this node if it’s been unmodified longer than the max_drift value, or the max_drift value is 0. Returns None otherwise.

```python
get_ninfo()
```

```python
get_path(dir=None)
```

Return path relative to the current working directory of the Node.FS.Base object that owns us.

```python
get_path_elements()
```

Get the path of the file relative to the root SConstruct file’s directory.

```python
get_size() → int
```

```python
get_source_scanner(node)
```

Fetch the source scanner for the specified node

NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.

Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.

This function may be called very often; it attempts to cache the scanner found to improve performance.

```python
get_state()
```

```python
get_stored_implicit()
```

Fetch the stored implicit dependencies

```python
get_stored_info()
```

```python
get_string(for_signature)
```

This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.

Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.

```python
get_subst_proxy()
```

This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to be in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

```python
get_suffix()
```

```python
get_target_scanner()
```

SCons.Node package 264
get_text_contents () → str
Return the contents of the file in text form.
This attempts to figure out what the encoding of the text is based upon the BOM bytes, and then decodes the contents so that it's a valid python string.

get_timestamp () → int

get_tpath ()

gmtime ()

gsize ()

has_builder ()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder ()
Return whether this Node has an explicit builder.
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

has_src_builder ()
Return whether this Node has a source builder or not.
If this Node doesn’t have an explicit source code builder, this is where we figure out, on the fly, if there’s a transparent source code builder for it.
Note that if we found a source builder, we also set the self.builder attribute, so that all of the methods that actually build this file don’t have to do anything different.

hash_chunksize = 65536

ignore

ignore_set

implicit

implicit_set

includes

is_conftest ()
Returns true if this node is a conftest node

is_derived ()
Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal ()
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript ()
Returns true if this node is an sconscript
is_under (dir)

is_up_to_date ()
  Check for whether the Node is current. In all cases, self is the target we're checking to see if it's up to date.

isdir ()
isfile ()
islink ()
linked
lstat ()

make_ready ()
  Get a Node ready for evaluation. This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing ()

multiple_side_effect_has_builder ()
  Return whether this Node has a builder or not. In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

must_be_same (klass)
  This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn't.

name

new_binfo ()

new_ninfo ()
ninfo

nocache

clean

on_disk_entries

postprocess ()
  Clean up anything we don't need to hang onto after we've been built.

precious

prepare ()
  Prepare for this file to be created.

prerequisites

pseudo

push_to_cache ()
  Try to push the node into a cache.
Called just after this node has been marked up-to-date or was built completely. This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption. We’d like to remove a lot more attributes like self.sources and self.sources_set, but they might get used in a next build step. For example, during configuration the source files for a built E(“).o file are used to figure out which linker to use for the resulting Program (gcc vs. g++)! That's why we check for the ‘keep_targetinfo’ attribute, config Nodes and the Interactive mode just don’t allow an early release of most variables. In the same manner, we can’t simply remove the self.attributes here. The smart linking relies on the shared flag, and some parts of the java Tool use it to transport information about nodes…

@see: built() and Node.release_target_info()

Remove this file.

Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

Remove cached executor; forces recompute when needed.

Try to retrieve the node’s content from a cache. This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built(). Returns true if the node was successfully retrieved.

Does this node exist locally or in a repository?

A Node.FS.Base object's string representation is its path name.

Scan this node’s dependents for implicit dependencies.

Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

```python
set_always_build(always_build=1)
    Set the Node’s always_build value.
```

```python
set_executor(executor)
    Set the action executor for this node.
```

```python
set_explicit(is_explicit)
```

```python
set_local()
```

```python
set_nocache(nocache=1)
    Set the Node’s nocache value.
```

```python
set_noclean(noclean=1)
    Set the Node’s noclean value.
```

```python
set_precious(precious=1)
    Set the Node’s precious value.
```

```python
set_pseudo(pseudo=True)
    Set the Node’s precious value.
```

```python
set_specific_source(source)
```

```python
set_src_builder(builder)
    Set the source code builder for this node.
```

```python
set_state(state)
```

```python
side_effect
```

```python
side_effects
```

```python
sources
```

```python
sources_set
```

```python
src_builder()
    Fetch the source code builder for this node.
    If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).
```

```python
srcdir
```

```python
srcnode()
    If this node is in a build path, return the node corresponding to its source file. Otherwise, return ourself.
```

```python
stat()
```

```python
state
```

```python
store_info
```

```python
str_for_display()
```

```python
target_from_source(prefix, suffix, splitext=<function splitext>)
    Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix.
```
Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.

```
    class SCons.Node.FS.FileBuildInfo
    Bases: SCons.Node.BuildInfoBase
    This is info loaded from sconsign.
    Attributes unique to FileBuildInfo:
      dependency_map : Caches file->csig mapping
          for all dependencies. Currently this is only used when using MD5-timestamp decider. It's used to ensure
          that we copy the correct csig from the previous build to be written to .sconsign when current build is done.
          Previously the matching of csig to file was strictly by order they appeared in bdepends, bsources, or
          bimplicit, and so a change in order or count of any of these could yield writing wrong csig, and then false
          positive rebuilds
```

```
    convert_from_sconsign (dir, name)
        Converts a newly-read FileBuildInfo object for in-SCons use
        For normal up-to-date checking, we don’t have any conversion to perform—but we’re leaving this method here to
        make that clear.
```

```
    convert_to_sconsign ()
        Converts this FileBuildInfo object for writing to a .sconsign file
        This replaces each Node in our various dependency lists with its usual string representation: relative to the
        top-level SConstruct directory, or an absolute path if it’s outside.
```

```
    current_version_id = 2
```

```
    dependency_map
```

```
    format (names=0)
```

```
    merge (other)
```
Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

```python
prepare_dependencies()
Prepares a FileBuildInfo object for explaining what changed
The bsources, bdepends and bimplicit lists have all been stored on disk as paths relative to the top-level SConstruct directory. Convert the strings to actual Nodes (for use by the --debug=explain code and --implicit-cache).
```

```python
exception SCons.Node.FS.FileBuildInfoFileToCsigMappingError
Bases: Exception

with_traceback()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.
```

```python
class SCons.Node.FS.FileFinder
Bases: object

_find_file_key (filename, paths, verbose=None)
```

```python
filedir_lookup (p, fd=None)
A helper method for find_file() that looks up a directory for a file we’re trying to find. This only creates the Dir Node if it exists on-disk, since if the directory doesn’t exist we know we won’t find any files in it... :-)
It would be more compact to just use this as a nested function with a default keyword argument (see the commented-out version below), but that doesn’t work unless you have nested scopes, so we define it here just so this work under Python 1.5.2.

find_file (filename, paths, verbose=None)
Find a node corresponding to either a derived file or a file that exists already.
Only the first file found is returned, and none is returned if no file is found.
filename: A filename to find paths: A list of directory path nodes to search in. Can be represented as a list, a tuple, or a callable that is called with no arguments and returns the list or tuple.
returns The node created from the found file.
```

```python
class SCons.Node.FS.FileNodeInfo

convert (node, val)

csig

current_version_id = 2

field_list = ['csig', 'timestamp', 'size']

format (field_list=None, names=0)

fs = None

merge (other)
Merge the fields of another object into this object. Already existing information is overwritten by the other instance’s data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

size

str_to_node(s)

timestamp
SCons.Node package

update (node)

SCons.Node.FS.LinkFunc (target, source, env)
Relative paths cause problems with symbolic links, so we use absolute paths, which may be a problem for people who want to move their soft-linked src-trees around. Those people should use the ‘hard-copy’ mode, softlinks cannot be used for that; at least I have no idea how ...

class SCons.Node.FS.LocalFS
Bases: object
This class implements an abstraction layer for operations involving a local file system. Essentially, this wraps any function in the os, os.path or shutil modules that we use to actually go do anything with or to the local file system. Note that there’s a very good chance we’ll refactor this part of the architecture in some way as we really implement the interface(s) for remote file system Nodes. For example, the right architecture might be to have this be a subclass instead of a base class. Nevertheless, we’re using this as a first step in that direction. We’re not using chdir() yet because the calling subclass method needs to use os.chdir() directly to avoid recursion. Will we really need this one?

chmod (path, mode)

copy (src, dst)

copy2 (src, dst)

exists (path)

getmtime (path)

getsize (path)

stat (path)

symlink (src, dst)

unlink (path)

SCons.Node.FS.LocalString (target, source, env)

SCons.Node.FS.MkdirFunc (target, source, env)
class SCons.Node.FS.RootDir (drive, fs)

    Bases: SCons.Node.FS.Dir

    A class for the root directory of a file system.
    This is the same as a Dir class, except that the path separator ('/' or '') is actually part of the name, so we don't need to add a separator when creating the path names of entries within this directory.

class Attrs

    Bases: object

    shared

BuildInfo

    alias of SCons.Node.FS.DirBuildInfo

Decider (function)

    Dir (name, create=True)
    Looks up or creates a directory node named ‘name’ relative to this directory.

    Entry (name)
    Looks up or creates an entry node named ‘name’ relative to this directory.

    File (name)
    Looks up or creates a file node named ‘name’ relative to this directory.

GetTag (key)

    Return a user-defined tag.

NodeInfo

    alias of SCons.Node.FS.DirNodeInfo

RDirs (pathlist)

    Search for a list of directories in the Repository list.

Rfindalldirs (pathlist)

    Return all of the directories for a given path list, including corresponding “backing” directories in any repositories. The Node lookups are relative to this Node (typically a directory), so memoizing result saves cycles from looking up the same path for each target in a given directory.

Tag (key, value)

    Add a user-defined tag.

    _Rfindalldirs_key (pathlist)

    _abspath

    _add_child (collection, set, child)
    Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

    _children_get ()

    _children_reset ()

    _create ()
    Create this directory, silently and without worrying about whether the builder is the default or not.

    _func_exists

    _func_get_contents

    _func_is Derived
SCons.Node package

_func_reexists
_func_sconsign
_func_target_from_source
_getScanner (env, initial_scanner, root_node_scanner, kw)
_get_str ()
_getglob (pattern, ondisk=True, source=False, strings=False)
Globs for and returns a list of entry names matching a single pattern in this directory. This searches any repositories and source directories for corresponding entries and returns a Node (or string) relative to the current directory if an entry is found anywhere. TODO: handle pattern with no wildcard

__labspath
__local

__lookupDict
__lookup_abs (p, klass, create=1)
Fast (?) lookup of a normalized absolute path. This method is intended for use by internal lookups with already-normalized path data. For general-purpose lookups, use the FS.Entry(), FS.Dir() or FS.File() methods. The caller is responsible for making sure we’re passed a normalized absolute path; we merely let Python’s dictionary look up and return the One True Node.FS object for the path. If a Node for the specified “p” doesn’t already exist, and “create” is specified, the Node may be created after recursive invocation to find or create the parent directory or directories.

__memo
__morph ()
Turn a file system Node (either a freshly initialized directory object or a separate Entry object) into a proper directory object. Set up this directory’s entries and hook it into the file system tree. Specify that directories (this Node) don’t use signatures for calculating whether they’re current.

__path
__path_elements
__proxy
__rel_path_key (other)
__save_str ()
__sconsign
__specific_sources
__srcdir_find_file_key (filename)
__tags
__tpath
abspath
SCons.Node package

`addRepository (dir)`

`add_dependency (depend)`
  Adds dependencies.

`add_ignore (depend)`
  Adds dependencies to ignore.

`add_prerequisite (prerequisite)`
  Adds prerequisites

`add_source (source)`
  Adds sources.

`add_to_implicit (deps)`

`add_to_waiting_parents (node)`
  Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don't think you can “clean up” this function by using True and False instead...)

`add_to_waiting_s_e (node)`

`add_wkid (wkid)`
  Add a node to the list of kids waiting to be evaluated

`all_children (scan=1)`
  Return a list of all the node's direct children.

`alter_targets ()`
  Return any corresponding targets in a variant directory.

`always_build`

`attributes`

`binfo`

`build (**kw)`
  A null “builder” for directories.

`builder`

`builder_set (builder)`

`built ()`
  Called just after this node is successfully built.

`cached`

`cachedir_csig`

`cachesig`

`changed (node=None, allowcache=False)`
  Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
  Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn’t needed any longer for subsequent calls to changed().

@see: FS.File.changed(), FS.File.release_target_info()

**changed_since_last_build**

**check_attributes** (name)
Simple API to check if the node.attributes for name has been set

**children** (scan=1)
Return a list of the node’s direct children, minus those that are ignored by this node.

**children_are_up_to_date ()**
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

**clear ()**
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

**clear_memoized_values ()**

**contentsig**

**cwd**

**del_binfo ()**
Delete the build info from this node.

**depends**

**depends_set**

**dir**

**dir_on_disk** (name)

**dirname**

**disambiguate** (must_exist=None)

**diskcheck_match ()**

**do_duplicate** (src)

**duplicate**

**entries**

**entry_abspath** (name)

**entry_exists_on_disk** (name)
Searches through the file/dir entries of the current directory, and returns True if a physical entry with the given name could be found.
@see: entry_exists_on_disk

**entry_labspath** (name)

**entry_path** (name)
entry_tpath (name)

env

env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

file_on_disk (name)

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

fs
    Reference to parent Node.FS object

getRepositories ()
    Returns a list of repositories for this directory.

get_abspath ()
    Get the absolute path of the file.

get_all_rdirs ()

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env ()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are sorted.

get_csig ()
Compute the content signature for Directory nodes. In general, this is not needed and the content signature is not stored in the DirNodeInfo. However, if get_contents on a Dir node is called which has a child directory, the child directory should return the hash of its contents.

get_dir()

get_env()

get_env_scanner(env, kw={})

get_executor(create=1)
Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes(env, scanner, path)
Return this directory’s implicit dependencies. We don’t bother caching the results because the scan typically shouldn’t be requested more than once (as opposed to scanning .h file contents, which can be requested as many times as the files is #included by other files).

get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node. This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the scanner, if the scanner’s recursive flag says that we should.

get_internal_path()

get_labspath()
Get the absolute path of the file.

get_ninfo()

get_path(dir=None)
Return path relative to the current working directory of the Node.FS.Base object that owns us.

get_path_elements()

get_relpath()
Get the path of the file relative to the root SConstruct file’s directory.

get_source_scanner(node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
Fetch the stored implicit dependencies

get_stored_info()

get_string(for_signature)
This is a convenience function designed primarily to be used in command generators (i.e., CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature argument that is nonzero if the command generator is being called to generate a signature for the command line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly, depending on whether we are calculating a signature or actually constructing a command line.
get_subst_proxy ()

This method is expected to return an object that will function exactly like this Node, except that it implements any additional special features that we would like to have in effect for Environment variable substitution. The principle use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this method to return self if no new functionality is needed for Environment substitution.

get_suffix ()

get_target_scanner ()

get_text_contents ()

We already emit things in text, so just return the binary version.

get_timestamp ()

Return the latest timestamp from among our children.

get_tpath ()

getsize ()

glob (pathname, ondisk=True, source=False, strings=False, exclude=None)

Returns a list of Nodes (or strings) matching a specified pathname pattern. Pathname patterns follow UNIX shell semantics: * matches any-length strings of any characters, ? matches any character, and [] can enclose lists or ranges of characters. Matches do not span directory separators. The matches take into account Repositories, returning local Nodes if a corresponding entry exists in a Repository (either an in-memory Node or something on disk).

By default, the glob() function matches entries that exist on-disk, in addition to in-memory Nodes. Setting the “ondisk” argument to False (or some other non-true value) causes the glob() function to only match in-memory Nodes. The default behavior is to return both the on-disk and in-memory Nodes.

The “source” argument, when true, specifies that corresponding source Nodes must be returned if you’re globbing in a build directory (initialized with VariantDir()). The default behavior is to return Nodes local to the VariantDir().

The “strings” argument, when true, returns the matches as strings, not Nodes. The strings are path names relative to this directory.

The “exclude” argument, if not None, must be a pattern or a list of patterns following the same UNIX shell semantics. Elements matching at least one pattern of this list will be excluded from the result.

The underlying algorithm is adapted from the glob.glob() function in the Python library (but heavily modified), and uses fnmatch() under the covers.

has_builder ()

Return whether this Node has a builder or not.

In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: …”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

has_explicit_builder ()

Return whether this Node has an explicit builder.

This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set
includes

is_conftest()  
Returns true if this node is a conftest node.

is_derived()  
Returns true if this node is derived (i.e. built).  
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()  
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()  
Returns true if this node is an sconscript.

is_under(dir)

is_up_to_date()  
If any child is not up-to-date, then this directory isn't, either.

isdir()

isfile()

islink()

link(srcdir, duplicate)  
Set this directory as the variant directory for the supplied source directory.

linked

lstat()

make_ready()  
Get a Node ready for evaluation.  
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()  
Return whether this Node has a builder or not.  
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

must_be_same(klass)  
This node, which already existed, is being looked up as the specified klass. Raise an exception if it isn’t.
Clean up anything we don’t need to hang onto after we’ve been built.

Prepare for this Node to be built. This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node. This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built. (The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.) Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

Try to push a node into a cache

Return a path to “other” relative to this directory.

Called just after this node has been marked up-to-date or was built completely. This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption. By purging attributes that aren’t needed any longer after a Node (=File) got built, we don’t have to care that much how many KBytes a Node actually requires…as long as we free the memory shortly afterwards. @see: built() and File.release_target_info()

Remove this Node: no-op by default.

Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

Searches through the file/dir entries of the current and all its remote directories (repos), and returns True if a physical entry with the given name could be found. The local directory (self) gets searched first, so repositories take a lower precedence regarding the searching order. @see entry_exists_on_disk
repositories

reset_executor ()
   Remove cached executor; forces recompute when needed.

retrieve_from_cache ()
   Try to retrieve the node's content from a cache
   This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
   unsafe stuff in built().
   Returns true if the node was successfully retrieved.

rexists ()
   Does this node exist locally or in a repository?

rfile ()

root

rstr ()
   A Node.FS.Base object's string representation is its path name.

sbuilder

scan ()
   Scan this node’s dependents for implicit dependencies.

scanner_key ()
   A directory does not get scanned.

scanner_paths

sconsign ()
   Return the .sconsign file info for this directory.

searched

select_scanner (scanner)
   Selects a scanner for this Node.
   This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use
   their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build (always_build=1)
   Set the Node's always_build value.

set_executor (executor)
   Set the action executor for this node.

set_explicit (is_explicit)

set_local ()

set_nocache (nocache=1)
   Set the Node's nocache value.

set_noclean (noclean=1)
   Set the Node's noclean value.

set_precious (precious=1)
   Set the Node's precious value.

set_pseudo (pseudo=True)
Set the Node's precious value.

```python
set_specific_source(source)
```

```python
set_src_builder(builder)
    Set the source code builder for this node.
```

```python
set_state(state)
```

```python
side_effect
```

```python
side_effects
```

```python
sources
```

```python
sources_set
```

```python
src_builder()
    Fetch the source code builder for this node.
    If there isn’t one, we cache the source code builder specified for the directory (which in turn will cache the value from its parent directory, and so on up to the file system root).
```

```python
srcdir
```

```python
srcdir_duplicate(name)
```

```python
srcdir_find_file(filename)
```

```python
srcdir_list()
```

```python
srcnode()
    Dir has a special need for srcnode()...if we have a srcdir attribute set, then that is our srcnode.
```

```python
stat()
```

```python
state
```

```python
store_info
```

```python
str_for_display()
```

```python
target_from_source(prefix, suffix, splitext=<function splitext>)
    Generates a target entry that corresponds to this entry (usually a source file) with the specified prefix and suffix. Note that this method can be overridden dynamically for generated files that need different behavior. See Tool/swig.py for an example.
```

```python
target_peers
```

```python
up()
```

```python
variant_dirs
```

```python
visited()
    Called just after this node has been visited (with or without a build).
```

```python
waiting_parents
```

```python
waiting_s_e
```

```python
walk(func, arg)
    Walk this directory tree by calling the specified function for each directory in the tree.
```
This behaves like the os.path.walk() function, but for in-memory Node.FS.Dir objects. The function takes the same arguments as the functions passed to os.path.walk():

```
func(arg, dirname, fnames)
```

Except that "dirname" will actually be the directory Node, not the string. The '.' and '..' entries are excluded from fnames. The fnames list may be modified in-place to filter the subdirectories visited or otherwise impose a specific order. The "arg" argument is always passed to func() and may be used in any way (or ignored, passing None is common).

```
kids
```

SCons.Node.FS.UnlinkFunc (target, source, env)

```
class SCons.Node.FS._Null
Bases: object
```

SCons.Node.FS._classEntry

```
alias of SCons.Node.FS.Entry
```

SCons.Node.FS._copy_func (fs, src, dest)

SCons.Node.FS._hardlink_func (fs, src, dst)

SCons.Node.FS._my_normcase (x)

SCons.Node.FS._my_splitdrive (p)

SCons.Node.FS._softlink_func (fs, src, dst)

SCons.Node.FS._diskcheck_types ()

SCons.Node.FS._do_diskcheck_match (node, predicate, errorfmt)

SCons.Node.FS._find_file (filename, paths, verbose=None)

Find a node corresponding to either a derived file or a file that exists already. Only the first file found is returned, and none is returned if no file is found.

filename: A filename to find paths: A list of directory path nodes to search in. Can be represented as a list, a tuple, or a callable that is called with no arguments and returns the list or tuple.

returns The node created from the found file.

SCons.Node.FS._get_MkdirBuilder ()

SCons.Node.FS._get_default_fs ()

SCons.Node.FS._has_glob_magic(s)

SCons.Node.FS._ignore_diskcheck_match (node, predicate, errorfmt)

SCons.Node.FS._initialize_do_splitdrive ()

SCons.Node.FS._invalidate_node_memos (targets)

Invalidates the memoized values of all Nodes (files or directories) that are associated with the given entries. Has been added to clean the cache of nodes affected by a direct execution of an action (e.g. Delete/Copy/Chmod). Existing Node caches become inconsistent if the action is run through Execute(). The argument targets can be a single Node object or filename, or a sequence of Nodes/filenames.

SCons.Node.FS._needs_normpath_match (string, pos=0, endpos=9223372036854775807)

Matches zero or more characters at the beginning of the string.

SCons.Node.FS._save_strings (val)

SCons.Node.FS._sconsign_dir (node)

Return the .sconsign file info for this directory, creating it first if necessary.

SCons.Node.FS._sconsign_none (node)

SCons.Node.FS._set_diskcheck (list)

SCons.Node.FS._set_duplicate (duplicate)
SCons.Node Python module

Python nodes.

class SCons.Node.Python.Value (value, built_value=None, name=None)
    A class for Python variables, typically passed on the command line or generated by a script, but not from a file or some other source.

class Attrs
    Bases: object

BuildInfo

Decider (function)

GetTag (key)
    Return a user-defined tag.

NodeInfo

Tag (key, value)
    Add a user-defined tag.

    __add_child (collection, set, child)
        Adds 'child' to 'collection', first checking 'set' to see if it's already present.

    __children_get ()

    __children_reset ()

    __func_exists

    __func_get_contents

    __func_is_derived

    __func_rexists

    __func_target_from_source

    __get_scanner (env, initial_scanner, root_node_scanner, kw)

    __memo

    __specific_sources

    __tags

    add_dependency (depend)
        Adds dependencies.

    add_ignore (depend)
        Adds dependencies to ignore.

    add_prerequisite (prerequisite)
        Adds prerequisites
add_source (source)
  Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
  Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not.
  (Note that the returned values are intended to be used to increment a reference count, so don’t think you can
  “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
  Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
  Return a list of all the node’s direct children.

alter_targets ()
  Return a list of alternate targets for this Node.

always_build

attributes

binfo

build (**kw)
  Actually build the node.
  This is called by the Taskmaster after it’s decided that the Node is out-of-date and must be rebuilt, and after the
  prepare() method has gotten everything, uh, prepared.
  This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
  unsafe stuff in built().

builder

builder_set (builder)

built ()
  Called just after this node is successfully built.

cached

changed (node=None, allowcache=False)
  Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is
to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically
one in a Repository) can be used instead.
  Note that we now always check every dependency. We used to short-circuit the check by returning as soon as
we detected any difference, but we now rely on checking every dependency to make sure that any necessary
Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a
File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like
this, the executor isn’t needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

changed_since_last_build

check_attributes (name)
  Simple API to check if the node.attributes for name has been set

children (scan=1)
Return a list of the node's direct children, minus those that are ignored by this node.

`children_are_up_to_date()`
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

`clear()`
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

`clear_memoized_values()`

`del_binfo()`
Delete the build info from this node.

`depends`

`depends_set`

`disambiguate(must_exist=None)`

`env`

`env_set(env, safe=0)`

`executor`

`executor_cleanup()`
Let the executor clean up any cached information.

`exists()`
Does this node exists?

`explain()`

`for_signature()`
Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

`get_abspath()`
Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a concept of relative path, this might return something different.

`get_binfo()`
Fetch a node's build information.

`node` - the node whose sources will be collected
`cache` - alternate node to use for the signature cache
`returns` - the build signature
This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

`get_build_env()`
Fetch the appropriate Environment to build this node.

`get_build_scanner_path(scanner)`
Fetch the appropriate scanner path for this node.
get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents () -> bytes
    Get contents for signature calculations.

get_csig (calc=None)
    Because we’re a Python value node and don’t have a real timestamp, we get to ignore the calculator and just
    use the value contents.
    Returns string. Ideally string of hex digits. (Not bytes)

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be
    scanned for implicit dependencies.

get_implicit_deps (env, initial_scanner, path_func, kw={})
    Return a list of implicit dependencies for this node.
    This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
    scanner, if the scanner’s recursive flag says that we should.

get_ninfo ()

get_source_scanner (node)
    Fetch the source scanner for the specified node
    NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
    Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
    This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state ()

get_stored_implicit ()
    Fetch the stored implicit dependencies

get_stored_info ()

get_string (for_signature)
    This is a convenience function designed primarily to be used in command generators (i.e.,
    CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
    argument that is nonzero if the command generator is being called to generate a signature for the command
    line, which determines if we should rebuild or not.
    Such command generators should use this method in preference to str(Node) when converting a Node to a
    string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
    depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy ()
    This method is expected to return an object that will function exactly like this Node, except that it implements any
    additional special features that we would like to be in effect for Environment variable substitution. The principle
    use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
    has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
    method to return self if no new functionality is needed for Environment substitution.
By the assumption that the node.built_value is a deterministic product of the sources, the contents of a Value are the concatenation of all the contents of its sources. As the value need not be built when get_contents() is called, we cannot use the actual node.built_value.

Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

Return whether this Node has an explicit builder.
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an explicit builder that the user supplies (the canonical example being directories).

Returns true if this node is an conftest node.

Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and should contribute their build signatures when they are used as source files to other derived files. For example: source with source builders are not derived in this sense, and hence should not return true.

Always pass the string representation of a Node to the command interpreter literally.

Returns true if this node is an sconscript

Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.
missing()

multiple_side_effect_has_builder()
    Return whether this Node has a builder or not.
    In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the __len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls and slowing things down immensely.

new_binfo()

new_ninfo()

ninfo

nocache

noclean

postprocess()
    Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
    Prepare for this Node to be built.
    This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before actually calling the method to build the Node.
    This default implementation checks that explicit or implicit dependencies either exist or are derived, and initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
    (The existence of source files is checked separately by the Executor, which aggregates checks for all of the targets built by a specific action.)
    Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

prerequisites

pseudo

push_to_cache()
    Try to push a node into a cache

read()
    Return the value. If necessary, the value is built.

ref_count

release_target_info()
    Called just after this node has been marked up-to-date or was built completely.
    This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
    By purging attributes that aren’t needed any longer after a Node (File) got built, we don’t have to care that much how many KBytes a Node actually requires...as long as we free the memory shortly afterwards.
    @see: built() and File.release_target_info()

remove()
    Remove this Node: no-op by default.

render_include_tree()
    Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.
reset_executor()
Remove cached executor; forces recompute when needed.

retrieve_from_cache()
Try to retrieve the node’s content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
unsafe stuff in built().
Returns true if the node was successfully retrieved.

rexists()
Does this node exist locally or in a repository?

scan()
Scan this node’s dependents for implicit dependencies.

scanner_key()

select_scanner(scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use
their own Scanner and don’t select one the Scanner.Selector that’s configured for the target.

set_always_build(always_build=1)
Set the Node’s always_build value.

set_executor(executor)
Set the action executor for this node.

set_explicit(is_explicit)

set_nocache(nocache=1)
Set the Node’s nocache value.

set_noclean(noclean=1)
Set the Node’s noclean value.

set_precious(precious=1)
Set the Node’s precious value.

set_pseudo(pseudo=True)
Set the Node’s precious value.

set_specific_source(source)

set_state(state)

side_effect

side_effects

**str_to_node(s)**

**update(node)**

SCons.Node.Python.ValueWithMemo (value, built_value=None, name=None)
Memoized Value() node factory.
Module contents

The Node package for the SCons software construction utility.

This is, in many ways, the heart of SCons.

A Node is where we encapsulate all of the dependency information about any thing that SCons can build, or about any thing which SCons can use to build some other thing. The canonical "thing," of course, is a file, but a Node can also represent something remote (like a web page) or something completely abstract (like an Alias).

Each specific type of "thing" is specifically represented by a subclass of the Node base class: Node.FS.File for files, Node.Alias for aliases, etc. Dependency information is kept here in the base class, and information specific to files/aliases/etc. is in the subclass. The goal, if we've done this correctly, is that any type of "thing" should be able to depend on any other type of "thing."

SCons.Node.Annotate (node)

class SCons.Node.BuildInfoBase

    Bases: object
    The generic base class for build information for a Node.

    This is what gets stored in a .sconsign file for each target file. It contains a NodeInfo instance for this node (signature information that's specific to the type of Node) and direct attributes for the generic build stuff we have to track: sources, explicit dependencies, implicit dependencies, and action information.

    bact
    bactsig
    bdepends
    bdependssigs
    bimplicit
    bimplicitsigs
    bsources
    bsourcesigs
    current_version_id = 2

    merge (other)
    Merge the fields of another object into this object. Already existing information is overwritten by the other instance's data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

class SCons.Node.Node

    Bases: object
    The base Node class, for entities that we know how to build, or use to build other Nodes.

class Attrs

    Bases: object

    shared

    BuildInfo
    alias of SCons.Node.BuildInfoBase

    Decider (function)
    GetTag (key)
    Return a user-defined tag.
NodeInfo
   alias of SCons.Node.NodeInfoBase

Tag (key, value)
   Add a user-defined tag.

_add_child (collection, set, child)
   Adds ‘child’ to ‘collection’, first checking ‘set’ to see if it’s already present.

_children_get ()

_children_reset ()

_func_exists

_func_get_contents

_func_is_derived

_func_rexists

_func_target_from_source

_get_scanner (env, initial_scanner, root_node_scanner, kw)

_mem

_specific_sources

_tags

add_dependency (depend)
   Adds dependencies.

add_ignore (depend)
   Adds dependencies to ignore.

add_prerequisite (prerequisite)
   Adds prerequisites

add_source (source)
   Adds sources.

add_to_implicit (deps)

add_to_waiting_parents (node)
   Returns the number of nodes added to our waiting parents list: 1 if we add a unique waiting parent, 0 if not. (Note that the returned values are intended to be used to increment a reference count, so don’t think you can “clean up” this function by using True and False instead…)

add_to_waiting_s_e (node)

add_wkid (wkid)
   Add a node to the list of kids waiting to be evaluated

all_children (scan=1)
   Return a list of all the node’s direct children.

alter_targets ()
   Return a list of alternate targets for this Node.
Always build the node.

This is called by the Taskmaster after it's decided that the Node is out-of-date and must be rebuilt, and after the prepare() method has gotten everything, uh, prepared. This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built().

Builder

Builder_set (builder)

Built ()
Called just after this node is successfully built.

Cached

Changed (node=None, allowcache=False)
Returns if the node is up-to-date with respect to the BuildInfo stored last time it was built. The default behavior is to compare it against our own previously stored BuildInfo, but the stored BuildInfo from another Node (typically one in a Repository) can be used instead.
Note that we now always check every dependency. We used to short-circuit the check by returning as soon as we detected any difference, but we now rely on checking every dependency to make sure that any necessary Node information (for example, the content signature of an #included .h file) is updated.
The allowcache option was added for supporting the early release of the executor/builder structures, right after a File target was built. When set to true, the return value of this changed method gets cached for File nodes. Like this, the executor isn't needed any longer for subsequent calls to changed().
@see: FS.File.changed(), FS.File.release_target_info()

Changed_since_last_build

Check_attributes (name)
Simple API to check if the node.attributes for name has been set

Children (scan=1)
Return a list of the node's direct children, minus those that are ignored by this node.

Children_are_up_to_date ()
Alternate check for whether the Node is current: If all of our children were up-to-date, then this Node was up-to-date, too.

Clear ()
Completely clear a Node of all its cached state (so that it can be re-evaluated by interfaces that do continuous integration builds).

Clear_memoized_values ()

Del_binfo ()
Delete the build info from this node.

Depends

Depends_set

Disambiguate (must_exist=None)
env

env_set (env, safe=0)

executor

executor_cleanup ()
    Let the executor clean up any cached information.

exists ()
    Does this node exists?

explain ()

for_signature ()
    Return a string representation of the Node that will always be the same for this particular Node, no matter what. This is by contrast to the __str__() method, which might, for instance, return a relative path for a file Node. The purpose of this method is to generate a value to be used in signature calculation for the command line used to build a target, and we use this method instead of str() to avoid unnecessary rebuilds. This method does not need to return something that would actually work in a command line; it can return any kind of nonsense, so long as it does not change.

get_abspath ()
    Return an absolute path to the Node. This will return simply str(Node) by default, but for Node types that have a concept of relative path, this might return something different.

get_binfo ()
    Fetch a node’s build information.
    node - the node whose sources will be collected cache - alternate node to use for the signature cache returns - the build signature
    This no longer handles the recursive descent of the node’s children’s signatures. We expect that they’re already built and updated by someone else, if that’s what’s wanted.

get_build_env ()
    Fetch the appropriate Environment to build this node.

get_build_scanner_path (scanner)
    Fetch the appropriate scanner path for this node.

get_builder (default_builder=None)
    Return the set builder, or a specified default value

get_cachedir_csig ()

get_contents ()
    Fetch the contents of the entry.

get_csig ()

get_env ()

get_env_scanner (env, kw={})

get_executor (create=1)
    Fetch the action executor for this node. Create one if there isn’t already one, and requested to do so.

get_found_includes (env, scanner, path)
    Return the scanned include lines (implicit dependencies) found in this node.
    The default is no implicit dependencies. We expect this method to be overridden by any subclass that can be scanned for implicit dependencies.
get_implicit_deps(env, initial_scanner, path_func, kw={})
Return a list of implicit dependencies for this node.
This method exists to handle recursive invocation of the scanner on the implicit dependencies returned by the
scanner, if the scanner’s recursive flag says that we should.

get_ninfo()

get_source_scanner(node)
Fetch the source scanner for the specified node
NOTE: “self” is the target being built, “node” is the source file for which we want to fetch the scanner.
Implies self.has_builder() is true; again, expect to only be called from locations where this is already verified.
This function may be called very often; it attempts to cache the scanner found to improve performance.

get_state()

get_stored_implicit()
Fetch the stored implicit dependencies

get_stored_info()

get_string(for_signature)
This is a convenience function designed primarily to be used in command generators (i.e.,
CommandGeneratorActions or Environment variables that are callable), which are called with a for_signature
argument that is nonzero if the command generator is being called to generate a signature for the command
line, which determines if we should rebuild or not.
Such command generators should use this method in preference to str(Node) when converting a Node to a
string, passing in the for_signature parameter, such that we will call Node.for_signature() or str(Node) properly,
depending on whether we are calculating a signature or actually constructing a command line.

get_subst_proxy()
This method is expected to return an object that will function exactly like this Node, except that it implements any
additional special features that we would like to be in effect for Environment variable substitution. The principle
use is that some Nodes would like to implement a __getattr__() method, but putting that in the Node type itself
has a tendency to kill performance. We instead put it in a proxy and return it from this method. It is legal for this
method to return self if no new functionality is needed for Environment substitution.

get_suffix()

get_target_scanner()

has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly (“if
node.builder: ...”). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

has_explicit_builder()
Return whether this Node has an explicit builder.
This allows an internal Builder created by SCons to be marked non-explicit, so that it can be overridden by an
explicit builder that the user supplies (the canonical example being directories).

ignore

ignore_set

implicit

implicit_set

includes
SCons.Node package

is_conftest()
Returns true if this node is an conftest node

is_derived()
Returns true if this node is derived (i.e. built).
This should return true only for nodes whose path should be in the variant directory when duplicate=0 and
should contribute their build signatures when they are used as source files to other derived files. For example:
source with source builders are not derived in this sense, and hence should not return true.

is_explicit

is_literal()
Always pass the string representation of a Node to the command interpreter literally.

is_sconscript()
Returns true if this node is an sconscript

is_up_to_date()
Default check for whether the Node is current: unknown Node subtypes are always out of date, so they will
always get built.

linked

make_ready()
Get a Node ready for evaluation.
This is called before the Taskmaster decides if the Node is up-to-date or not. Overriding this method allows for a
Node subclass to be disambiguated if necessary, or for an implicit source builder to be attached.

missing()

multiple_side_effect_has_builder()
Return whether this Node has a builder or not.
In Boolean tests, this turns out to be a lot more efficient than simply examining the builder attribute directly ("if
node.builder: ..."). When the builder attribute is examined directly, it ends up calling __getattr__ for both the
__len__ and __bool__ attributes on instances of our Builder Proxy class(es), generating a bazillion extra calls
and slowing things down immensely.

new_binfo()
new_ninfo()
ninfo
nocache
noclean

postprocess()
Clean up anything we don’t need to hang onto after we’ve been built.

precious

prepare()
Prepare for this Node to be built.
This is called after the Taskmaster has decided that the Node is out-of-date and must be rebuilt, but before
actually calling the method to build the Node.
This default implementation checks that explicit or implicit dependencies either exist or are derived, and
initializes the BuildInfo structure that will hold the information about how this node is, uh, built.
(The existence of source files is checked separately by the Executor, which aggregates checks for all of the
targets built by a specific action.)
Overriding this method allows for a Node subclass to remove the underlying file from the file system. Note that subclass methods should call this base class method to get the child check and the BuildInfo structure.

**prerequisites**

pseudo

push_to_cache ()
Try to push a node into a cache

ref_count

release_target_info ()
Called just after this node has been marked up-to-date or was built completely.
This is where we try to release as many target node infos as possible for clean builds and update runs, in order to minimize the overall memory consumption.
By purging attributes that aren't needed any longer after a Node (=File) got built, we don't have to care that much how many KBytes a Node actually requires...as long as we free the memory shortly afterwards.
@see: built() and File.release_target_info()

remove ()
Remove this Node: no-op by default.

render_include_tree ()
Return a text representation, suitable for displaying to the user, of the include tree for the sources of this node.

reset_executor ()
Remove cached executor; forces recompute when needed.

retrieve_from_cache ()
Try to retrieve the node's content from a cache
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in built(). Returns true if the node was successfully retrieved.

rexists ()
Does this node exist locally or in a repository?

scan ()
Scan this node's dependents for implicit dependencies.

scanner_key ()

select_scanner (scanner)
Selects a scanner for this Node.
This is a separate method so it can be overridden by Node subclasses (specifically, Node.FS.Dir) that must use their own Scanner and don't select one the Scanner.Selector that's configured for the target.

set_always_build (always_build=1)
Set the Node's always_build value.

set_executor (executor)
Set the action executor for this node.

set_explicit (is_explicit)

set_nocache (nocache=1)
Set the Node's nocache value.

set_noclean (noclean=1)
Set the Node's noclean value.
SCons.Node package

```python
def set_precious(precious=1):
    Set the Node's precious value.

def set_pseudo(pseudo=True):
    Set the Node's precious value.

def set_specific_source(source):

def set_state(state):

def side_effect:

def side_effects:

def sources:

def sources_set:

def state:

def store_info:

def target_peers:

def visited():
    Called just after this node has been visited (with or without a build).

def waiting_parents:

def waiting_s_e:

def wkids:

class SCons.Node.NodeInfoBase:
    Bases: object
    The generic base class for signature information for a Node.
    Node subclasses should subclass NodeInfoBase to provide their own logic for dealing with their own Node-specific
    signature information.

def convert(node, val):

def current_version_id = 2

def format(field_list=None, names=0):

def merge(other):
    Merge the fields of another object into this object. Already existing information is overwritten by the other
    instance's data. WARNING: If a '__dict__' slot is added, it should be updated instead of replaced.

def update(node):

class SCons.Node.NodeList(initlist=None):
    Bases: collections.UserList

    _abc_impl = __abc_data object>

    def append(item):
        S.append(value) – append value to the end of the sequence

    def clear() → None – remove all items from S
```
copy ()

count (value) → integer – return number of occurrences of value

extend (other)
 S.extend(iterable) – extend sequence by appending elements from the iterable

index (value[, start[, stop]]) → integer – return first index of value.
 Raises ValueError if the value is not present.
 Supporting start and stop arguments is optional, but recommended.

insert (i, item)
 S.insert(index, value) – insert value before index

pop ([, index]) → item – remove and return item at index (default last).
 Raise IndexError if list is empty or index is out of range.

remove (item)
 S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
 S.reverse() – reverse IN PLACE

sort (*args, **kwds)

class SCons.Node.Walker (node, kids_func=<function get_children>, cycle_func=<function ignore_cycle>, eval_func=<function do_nothing>)
 Bases: object
 An iterator for walking a Node tree.
 This is depth-first, children are visited before the parent. The Walker object can be
 initialized with any node, and returns the next node on the descent with each get_next() call.
 get the children of a node instead of calling ‘children’. ‘cycle_func’ is an optional function that
 will be called when a cycle is detected.
 This class does not get caught in node cycles caused, for example, by C header file include loops.

get_next ()
 Return the next node for this walk of the tree.
 This function is intentionally iterative, not recursive, to sidestep any issues of stack size limitations.

is_done ()

SCons.Node.changed_since_last_build_alias (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_entry (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_node (node, target, prev_ni, repo_node=None)
 Must be overridden in a specific subclass to return True if this Node (a dependency) has changed since
 the last time it was used to build the specified target. prev_ni is this Node’s state (for example, its file
 timestamp, length, maybe content signature) as of the last time the target was built.
 Note that this method is called through the dependency, not the target, because a dependency Node must be
 able to use its own logic to decide if it changed. For example, File Nodes need to obey if we’re configured to use
 timestamps, but Python Value Nodes never use timestamps and always use the content. If this method were
 called through the target, then each Node’s implementation of this method would have to have more complicated
 logic to handle all the different Node types on which it might depend.
SCons.Node.changed_since_last_build_python (node, target, prev_ni, repo_node=None)
SCons.Node.changed_since_last_build_state_changed (node, target, prev_ni, repo_node=None)
SCons.Node.classname (obj)
SCons.Node.decide_source (node, target, prev_ni, repo_node=None)
SCons.Node.decide_target (node, target, prev_ni, repo_node=None)
SCons.Node.do_nothing (node, parent)
SCons.Node

- **do_nothing_node** (node)
- **exists_always** (node)
- **exists_base** (node)
- **exists_entry** (node)
  - Return if the Entry exists. Check the file system to see what we should turn into first. Assume a file if there’s no directory.
- **exists_file** (node)
- **exists_none** (node)
- **get_children** (node, parent)
- **get_contents_dir** (node)
  - Return content signatures and names of all our children separated by new-lines. Ensure that the nodes are sorted.
- **get_contents_entry** (node)
  - Fetch the contents of the entry. Returns the exact binary contents of the file.
- **get_contents_file** (node)
- **get_contents_none** (node)
- **ignore_cycle** (node, stack)
- **is_derived_node** (node)
  - Returns true if this node is derived (i.e. built).

- **rexists_node** (node)
- **rexists_none** (node)
- **store_info_file** (node)
- **store_info_pass** (node)
- **target_from_source_base** (node, prefix, suffix, splitext)
- **target_from_source_none** (node, prefix, suffix, splitext)

---

### SCons.Platform package

#### Submodules

**SCons.Platform.aix module**

Platform-specific initialization for IBM AIX systems.

There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

- **generate** (env)
- **get_xlc** (env, xlc=None, packages=[])  

**SCons.Platform.cygwin module**

Platform-specific initialization for Cygwin systems.

There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

- **generate** (env)
### SCons.Platform.darwin module
Platform-specific initialization for Mac OS X systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

```python
SCons.Platform.darwin.generate(env)
```

### SCons.Platform.hpux module
Platform-specific initialization for HP-UX systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

```python
SCons.Platform.hpux.generate(env)
```

### SCons.Platform.irix module
Platform-specific initialization for SGI IRIX systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

```python
SCons.Platform.irix.generate(env)
```

### SCons.Platform.mingw module
Platform-specific initialization for the MinGW system.

### SCons.Platform.os2 module
Platform-specific initialization for OS/2 systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

```python
SCons.Platform.os2.generate(env)
```

### SCons.Platform.posix module
Platform-specific initialization for POSIX (Linux, UNIX, etc.) systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

#### SCons.Platform.posix.escape (arg)
escape shell special characters

```python
SCons.Platform.posix.escape(arg)
```

#### SCons.Platform.posix.exec_popen3 (l, env, stdout, stderr)

```python
SCons.Platform.posix.exec_popen3(l, env, stdout, stderr)

#### SCons.Platform.posix.exec_subprocess (l, env)

```python
SCons.Platform.posix.exec_subprocess(l, env)
```

#### SCons.Platform.posix.piped_env_spawn (sh, escape, cmd, args, env, stdout, stderr)

```python
SCons.Platform.posix.piped_env_spawn(sh, escape, cmd, args, env, stdout, stderr)
```

#### SCons.Platform.posix.subprocess_spawn (sh, escape, cmd, args, env)

```python
SCons.Platform.posix.subprocess_spawn(sh, escape, cmd, args, env)
```

### SCons.Platform.sunos module
Platform-specific initialization for Sun systems.
There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

```python
SCons.Platform.sunos.generate(env)
```
**SCons.Platform.virtualenv module**

'Platform' support for a Python virtualenv.

**SCons.Platform.virtualenv.ImportVirtualenv (env)**
Copies virtualenv-related environment variables from OS environment to env['ENV'] and prepends virtualenv's PATH to env['ENV']['PATH'].

**SCons.Platform.virtualenv.IsInVirtualenv (path)**
Returns True, if path is under virtualenv's home directory. If not, or if we don't use virtualenv, returns False.

**SCons.Platform.virtualenv.Virtualenv ()**
Returns path to the virtualenv home if scons is executing within a virtualenv or None, if not.

**SCons.Platform.virtualenv._enable_virtualenv_default ()**

**SCons.Platform.virtualenv._ignore_virtualenv_default ()**

**SCons.Platform.virtualenv._inject_venv_path (env, path_list=None)**
Modify environment such that SCons will take into account its virtualenv when running external tools.

**SCons.Platform.virtualenv._inject_venv_variables (env)**

**SCons.Platform.virtualenv._is_path_in (path, base)**
Returns true if path is located under the base directory.

**SCons.Platform.virtualenv._running_in_virtualenv ()**
Returns True if scons is executed within a virtualenv

**SCons.Platform.virtualenv.select_paths_in_venv (path_list)**
Returns a list of paths from path_list which are under virtualenv’s home directory.

**SCons.Platform.win32 module**

Platform-specific initialization for Win32 systems.

There normally shouldn’t be any need to import this module directly. It will usually be imported through the generic SCons.Platform.Platform() selection method.

**class SCons.Platform.win32.ArchDefinition (arch, synonyms=[])**
Bases: object

Determine which windows CPU were running on. A class for defining architecture-specific settings and logic.

**SCons.Platform.win32.escape (x)**

**SCons.Platform.win32.exec_spawn (l, env)**

**SCons.Platform.win32.generate (env)**

**SCons.Platform.win32.get_architecture (arch=None)**
Returns the definition for the specified architecture string.
If no string is specified, the system default is returned (as defined by the PROCESSOR_ARCHITEW6432 or PROCESSOR_ARCHITECY environment variables).

**SCons.Platform.win32.get_program_files_dir ()**
Get the location of the program files directory

**SCons.Platform.win32.get_system_root ()**

**SCons.Platform.win32.piped_spawn (sh, escape, cmd, args, env, stdout, stderr)**

**SCons.Platform.win32.spawn (sh, escape, cmd, args, env)**

**SCons.Platform.win32.spawnve (mode, file, args, env)**

**Module contents**

SCons platform selection.

Looks for modules that define a callable object that can modify a construction environment as appropriate for a given platform.
Note that we take a more simplistic view of “platform” than Python does. We’re looking for a single string that determines a set of tool-independent variables with which to initialize a construction environment. Consequently, we’ll examine both sys.platform and os.name (and anything else that might come in to play) in order to return some specification which is unique enough for our purposes.

Note that because this subsystem just selects a callable that can modify a construction environment, it’s possible for people to define their own “platform specification” in an arbitrary callable function. No one needs to use or tie in to this subsystem in order to roll their own platform definition.

SCons.Platform.DefaultToolList (platform, env)
Select a default tool list for the specified platform.

SCons.Platform.Platform (name='darwin')
Select a canned Platform specification.

class SCons.Platform.PlatformSpec (name, generate)
Bases: object

class SCons.Platform.TempFileMunge (cmd, cmdstr=None)
Bases: object
Convert long command lines to use a temporary file.
You can set an Environment variable (usually TEMPFILE) to this, then call it with a string argument, and it will perform temporary file substitution on it. This is used to circumvent limitations on the length of command lines. Example:

```
env['TEMPFILE'] = TempFileMunge
env['LINKCOM'] = '${TEMPFILE('$LINK $TARGET $SOURCES','$LINKCOMSTR')}'
```

By default, the name of the temporary file used begins with a prefix of ‘@’. This may be configured for other tool chains by setting the TEMPFILEPREFIX variable. Example:

```
env['TEMPFILEPREFIX'] = '-@'  # diab compiler
env['TEMPFILEPREFIX'] = '-via'  # arm tool chain
env['TEMPFILEPREFIX'] = ''  # (the empty string) PC Lint
```

You can configure the extension of the temporary file through the TEMPFILESUFFIX variable, which defaults to ‘.link’ (see comments in the code below). Example:

```
env['TEMPFILESUFFIX'] = '.lnt'  # PC Lint
```

Entries in the temporary file are separated by the value of the TEMPFILEARGJOIN variable, which defaults to an OS-appropriate value.
A default argument escape function is SCons.Subst.quote_spaces. If you need to apply extra operations on a command argument before writing to a temporary file (fix Windows slashes, normalize paths, etc.), please set TEMPFILEARGESCFUNC variable to a custom function. Example:

```
import sys
import re
from SCons.Subst import quote_spaces

WINPATHSEP_RE = re.compile(r"\\([^"\'\"]\]|$)"

def tempfile_arg_esc_func(arg):
    arg = quote_spaces(arg)
    if sys.platform != "win32":
        return arg
    # GCC requires double Windows slashes, let's use UNIX separator
    return WINPATHSEP_RE.sub(r"/\", arg)

env['TEMPFILEARGESCFUNC'] = tempfile_arg_esc_func
```

Bitte verbinden Sie __print_cmd_str (target, source, env, cmdstr)
SCons.Platform.
platform_default ()
Return the platform string for our execution environment.
The returned value should map to one of the SCons/Platform/*.py files. Since scons is architecture independent,
though, we don't care about the machine architecture.

SCons.Platform.
platform_module (name='darwin')
Return the imported module for the platform.
This looks for a module name that matches the specified argument. If the name is unspecified, we fetch the
appropriate default for our execution environment.

SCons.Scanner package

Submodules

SCons.Scanner.C module
Dependency scanner for C/C++ code.
SCons.Scanner.C.
CConditionalScanner ()
Return an advanced conditional Scanner instance for scanning source files
Interprets C/C++ Preprocessor conditional syntax (#ifdef, #if, defined, #else, #elif, etc.).
SCons.Scanner.C.
CScanner ()
Return a prototype Scanner instance for scanning source files that use the C pre-processor

class SCons.Scanner.C.
SConsCPPConditionalScanner (*args, **kw)
Bases: SCons.cpp.
PreProcessor
SCons-specific subclass of the cpp.py module’s processing.
We subclass this so that: 1) we can deal with files represented by Nodes, not strings; 2) we can keep track of the
files that are missing.

_do_if_else_condition (condition)
Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

_match_tuples (tuples)

_parse_tuples (contents)

_process_tuples (tuples, file=None)

all_include ()

do_define ()
Default handling of a #define line.

do_elif ()
Default handling of a #elif line.

do_else ()
Default handling of a #else line.

do endif ()
Default handling of a #endif line.

do if ()
Default handling of a #if line.

do ifdef ()
Default handling of a ifndef line.
SCons.Scanner package

do ifndef ()
    Default handling of a #ifndef line.

do import ()
    Default handling of a #import line.

do include ()
    Default handling of a #include line.

do include_next ()
    Default handling of a #include line.

do nothing ()
    Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

do undef ()
    Default handling of a #undef line.

eval_expression ()
    Evaluates a C preprocessor expression.
    This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track #define values.

finalize_result (fname)

find_include_file ()
    Finds the #include file for a given preprocessor tuple.

initialize_result (fname)

process_contents (contents)
    Pre-processes a file contents.
    Is used by tests

process_file (file)
    Pre-processes a file.
    This is the main internal entry point.

read_file (file)

resolve_include ()
    Resolve a tuple-ized #include line.
    This handles recursive expansion of values without "" or <> surrounding the name until an initial " or < is found, to handle #include FILE where FILE is a #define somewhere else.

restore ()
    Pops the previous dispatch table off the stack and makes it the current one.

save ()
    Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

scons_current_file ()

start_handling_includes (t=None)
    Causes the PreProcessor object to start processing #import, #include and #include_next lines.
    This method will be called when a #if, #ifdef, #ifndef or #elif evaluates True, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated False.

stop_handling_includes (t=None)
    Causes the PreProcessor object to stop processing #import, #include and #include_next lines.
SCons.Scanner package

This method will be called when a #if, #ifdef, #ifndef or #elif evaluates False, or when we reach the #else in a #if, #ifdef, #ifndef or #elif block where a condition already evaluated True.

tupleize (contents)

Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file. The first element of each tuple is the line's preprocessor directive (#if, #include, #define, etc., minus the initial '#'). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.

class SCons.Scanner.C.SConsCPPConditionalScannerWrapper (name, variable)

Bases: object

The SCons wrapper around a cpp.py scanner. This is the actual glue between the calling conventions of generic SCons scanners, and the (subclass of) cpp.py class that knows how to look for #include lines with reasonably real C-preprocessor-like evaluation of #if/#ifdef/#else/#elif lines.

recurse_nodes (nodes)

select (node)

class SCons.Scanner.C.SConsCPPScanner (*args, **kw)

Bases: SCons.cpp.PreProcessor

SCons-specific subclass of the cpp.py module’s processing. We subclass this so that: 1) we can deal with files represented by Nodes, not strings; 2) we can keep track of the files that are missing.

_do_if_else_condition (condition)

Common logic for evaluating the conditions on #if, #ifdef and #ifndef lines.

_match_tuples (tuples)

_parse_tuples (contents)

_process_tuples (tuples, file=None)

all_include (!)

do_define (!)

    Default handling of a #define line.

do_elif (!)

    Default handling of a #elif line.

do_else (!)

    Default handling of a #else line.

do_endif (!)

    Default handling of a #endif line.

do_if (!)

    Default handling of a #if line.

do ifndef (!)

    Default handling of a #ifndef line.

do ifndef (!)

    Default handling of a #ifndef line.

do include (!)
Default handling of a #include line.

```c
do_include_next (t)
Default handling of a #include line.
```

Null method for when we explicitly want the action for a specific preprocessor directive to do nothing.

```c
do_nothing (t)
```

Default handling of a #undef line.

```c
do_undef (t)
```

Evaluates a C preprocessor expression. This is done by converting it to a Python equivalent and eval()ing it in the C preprocessor namespace we use to track #define values.

```c
eval_expression (t)
```

Finds the #include file for a given preprocessor tuple.

```c
find_include_file (t)
```

Pre-processes a file contents.

```c
process_contents (contents)
```

Pre-processes a file.

```c
process_file (file)
```

This is the main internal entry point.

```c
read_file (file)
```

Resolve a tuple-ized #include line.

```c
resolve_include (t)
```

Resolve a tuple-ized #include line.

```c
restore ()
```

Pops the previous dispatch table off the stack and makes it the current one.

```c
save ()
```

Pushes the current dispatch table on the stack and re-initializes the current dispatch table to the default.

```c
scons_current_file (t)
```

Causes the PreProcessor object to start processing #import, #include and #include_next lines.

```c
start_handling_includes (t=None)
```

This method will be called when a #if, #ifdef, ifndef or #elif evaluates True, or when we reach the #else in a #if, #ifdef, ifndef or #elif block where a condition already evaluated False.

```c
stop_handling_includes (t=None)
```

Causes the PreProcessor object to stop processing #import, #include and #include_next lines.

```c
stop_handling_includes (t=None)
```

This method will be called when a #if, #ifdef, ifndef or #elif evaluates False, or when we reach the #else in a #if, #ifdef, ifndef or #elif block where a condition already evaluated True.

```c
tupleize (contents)
```

Turns the contents of a file into a list of easily-processed tuples describing the CPP lines in the file.

The first element of each tuple is the line's preprocessor directive (#if, #include, #define, etc., minus the initial '#'). The remaining elements are specific to the type of directive, as pulled apart by the regular expression.
class SCons.Scanner.C.SConsCPPScannerWrapper (name, variable)
Bases: object
The SCons wrapper around a cpp.py scanner.
This is the actual glue between the calling conventions of generic SCons scanners, and the (subclass of) cpp.py class that knows how to look for #include lines with reasonably real C-preprocessor-like evaluation of #if/#ifdef/#else/#elif lines.

recurse_nodes (nodes)

select (node)
SCons.Scanner.C.dictify_CPPDEFINES (env)

SCons.Scanner.D module
Scanner for the Digital Mars “D” programming language.
Coded by Andy Friesen, 17 Nov 2003

class SCons.Scanner.D.D
Bases: SCons.Scanner.Classic

_recurse_all_nodes (nodes)

_recurse_no_nodes (nodes)

add_scanner (skey, scanner)

add_skey (skey)
   Add a skey to the list of skeys

find_include (include, source_dir, path)

find_include_names (node)

get_skeys (env=None)

path (env, dir=None, target=None, source=None)

scan (node, path=())

select (node)

sort_key (include)
SCons.Scanner.D.DScanner ()
   Return a prototype Scanner instance for scanning D source files

SCons.Scanner.Dir module
SCons.Scanner.Dir.DirEntryScanner (**kw)
   Return a prototype Scanner instance for “scanning” directory Nodes for their in-memory entries
SCons.Scanner.Dir.DirScanner (**kw)
   Return a prototype Scanner instance for scanning directories for on-disk files
SCons.Scanner.Dir.do_not_scan (k)
SCons.Scanner.Dir.only_dirs (nodes)
SCons.Scanner.Dir.scan_in_memory (node, env, path=())
   “Scans” a Node.FS.Dir for its in-memory entries.
SCons.Scanner.Dir.scan_on_disk (node, env, path=())
SCons.Scanner package

Scans a directory for on-disk files and directories therein. Looking up the entries will add these to the in-memory Node tree representation of the file system, so all we have to do is just that and then call the in-memory scanning function.

**SCons.Scanner.Fortran module**

Dependency scanner for Fortran code.

class SCons.Scanner.Fortran.F90Scanner (name, suffixes, path_variable, use_regex, incl_regex, def_regex, *args, **kw)

    Bases: SCons.Scanner.Classic
    A Classic Scanner subclass for Fortran source files which takes into account both USE and INCLUDE statements. This scanner will work for both F77 and F90 (and beyond) compilers. Currently, this scanner assumes that the include files do not contain USE statements. To enable the ability to deal with USE statements in include files, add logic right after the module names are found to loop over each include file, search for and locate each USE statement, and append each module name to the list of dependencies. Caching the search results in a common dictionary somewhere so that the same include file is not searched multiple times would be a smart thing to do.

    _recurse_all_nodes (nodes)
    _recurse_no_nodes (nodes)
    add_scanner (skey, scanner)
    add_skey (skey)
        Add a skey to the list of skeys
    find_include (include, source_dir, path)
    find_include_names (node)
    get_skeys (env=None)
    path (env, dir=None, target=None, source=None)
    scan (node, env, path=())
    select (node)
    sort_key (include)

SCons.Scanner.Fortran.FortranScan (path_variable='FORTRANPATH')
    Return a prototype Scanner instance for scanning source files for Fortran USE & INCLUDE statements

**SCons.Scanner.IDL module**

Dependency scanner for IDL (Interface Definition Language) files.

SCons.Scanner.IDL.IDLScan ()
    Return a prototype Scanner instance for scanning IDL source files

**SCons.Scanner.LaTeX module**

Dependency scanner for LaTeX code.

class SCons.Scanner.LaTeX.FindENVPathDirs (variable)

    Bases: object
    A class to bind a specific E{*}PATH variable name to a function that will return all of the E{*}path directories.

class SCons.Scanner.LaTeX.LaTeX (name, suffixes, graphics_extensions, *args, **kw)
SCons.Scanner package

Bases: `SCons.Scanner.Base`
Class for scanning LaTeX files for included files.

Unlike most scanners, which use regular expressions that just return the included file name, this returns a tuple consisting of the keyword for the inclusion ("include", "includegraphics", "input", or "bibliography"), and then the file name itself. Based on a quick look at LaTeX documentation, it seems that we should append .tex suffix for the "include" keywords, append .tex if there is no extension for the "input" keyword, and need to add .bib for the "bibliography" keyword that does not accept extensions by itself.

Finally, if there is no extension for an "includegraphics" keyword latex will append .ps or .eps to find the file, while pdftex may use .pdf, .jpg, .tif, .mps, or .png.

The actual subset and search order may be altered by DeclareGraphicsExtensions command. This complication is ignored. The default order corresponds to experimentation with teTeX:

```
$ latex --version
pdfeTeX 3.141592-1.21a-2.2 (Web2C 7.5.4)
kpathsea version 3.5.4
```

The order is:

- ['.eps', '.ps'] for latex
- ['.png', '.pdf', '.jpg', '.tif'] for pdftex

Another difference is that the search path is determined by the type of the file being searched: env['TEXINPUTS'] for "input" and "include" keywords, env['TEXINPUTS'] for "includegraphics" keyword, env['TEXINPUTS'] for "lstinputlisting" keyword, env['BIBINPUTS'] for "bibliography" keyword, env['BSTINPUTS'] for "bibliographystyle" keyword, env['INDEXSTYLE'] for "makeindex" keyword, no scanning support needed just allows user to set it if needed.

FIXME: also look for the class or style in document[class|style]{}

FIXME: also look for the argument of bibliographystyle{}

```

```
SCons.Scanner package

.. code-block:: python

    select (node)

    sort_key (include)

    two_arg_commands = ['import', 'subimport', 'includefrom', 'subincludefrom', 'inputfrom', 'subinputfrom']

SCons.Scanner.LaTeX.LaTeXScanner ()
    Return a prototype Scanner instance for scanning LaTeX source files when built with latex.

SCons.Scanner.LaTeX.PDFlatexScanner ()
    Return a prototype Scanner instance for scanning LaTeX source files when built with pdflatex.

class SCons.Scanner.LaTeX._Null
    Bases: object

SCons.Scanner.LaTeX._null alias of SCons.Scanner.LaTeX._Null

SCons.Scanner.LaTeX.modify_env_var (env, var, abspath)

## SCons.Scanner.Prog module

Dependency scanner for program files.

SCons.Scanner.Prog.ProgramScanner (**kw)
    Return a prototype Scanner instance for scanning executable files for static-lib dependencies

SCons.Scanner.Prog._subst_libs (env, libs)
    Substitute environment variables and split into list.

SCons.Scanner.Prog.scan (node, env, libpath=())
    Scans program files for static-library dependencies.
    It will search the LIBPATH environment variable for libraries specified in the LIBS variable, returning any files it finds as dependencies.

## SCons.Scanner.RC module

Dependency scanner for RC (Interface Definition Language) files.

SCons.Scanner.RC.RCScan ()
    Return a prototype Scanner instance for scanning RC source files

SCons.Scanner.RC.no_tlb (nodes)
    Filter out .tlb files as they are binary and shouldn’t be scanned.

## SCons.Scanner.SWIG module

Dependency scanner for SWIG code.

SCons.Scanner.SWIG.SWIGScanner ()

## Module contents

The Scanner package for the SCons software construction utility.

.. code-block:: python

    class SCons.Scanner.Base (function, name='NONE', argument=<class 'SCons.Scanner._Null'>, skeys=<class 'SCons.Scanner._Null'>, path_function=None, node_class=<class 'SCons.Node.FS.Base'>, node_factory=None, scan_check=False, recursive=None)
        Bases: object
        Base class for dependency scanners.
        This implements straightforward, single-pass scanning of a single file.

        _recurse_all_nodes (nodes)
SCons.Scanner package

```python
_recursively_no_nodes (nodes)
add_scanner (skey, scanner)
add_skey (skey)
  Add a skey to the list of skeys
get_skeys (env=None)
path (env, dir=None, target=None, source=None)
select (node)

class SCons.Scanner.Classic (name, suffixes, path_variable, regex, *args, **kw)
Bases: SCons.Scanner.Current
A Scanner subclass to contain the common logic for classic CPP-style include scanning, but which can be customized to use different regular expressions to find the includes.
Note that in order for this to work "out of the box" (without overriding the find_include() and sort_key() methods), the regular expression passed to the constructor must return the name of the include file in group 0.

_recursively_all_nodes (nodes)
_recursively_no_nodes (nodes)
add_scanner (skey, scanner)
add_skey (skey)
  Add a skey to the list of skeys
find_include (include, source_dir, path)
find_include_names (node)
get_skeys (env=None)
path (env, dir=None, target=None, source=None)
scan (node, path=())
select (node)
sort_key (include)

class SCons.Scanner.ClassicCPP (name, suffixes, path_variable, regex, *args, **kw)
Bases: SCons.Scanner.Classic
A Classic Scanner subclass which takes into account the type of bracketing used to include the file, and uses classic CPP rules for searching for the files based on the bracketing.
Note that in order for this to work, the regular expression passed to the constructor must return the leading bracket in group 0, and the contained filename in group 1.

_recursively_all_nodes (nodes)
_recursively_no_nodes (nodes)
add_scanner (skey, scanner)
add_skey (skey)
  Add a skey to the list of skeys
find_include (include, source_dir, path)
```

313
find_include_names(node)

get_skeys(env=None)

path(env, dir=None, target=None, source=None)

scan(node, path=())

select(node)

sort_key(include)

class SCons.Scanner.Current(*args, **kw)
    Bases: SCons.Scanner.Base
    A class for scanning files that are source files (have no builder) or are derived files and are current (which implies that they exist, either locally or in a repository).

    __recurse_all_nodes(nodes)

    __recurse_no_nodes(nodes)

    add_scanner(skey, scanner)

    add_skey(skey)
        Add a skey to the list of skeys

    get_skeys(env=None)

    path(env, dir=None, target=None, source=None)

    select(node)

class SCons.Scanner.FindPathDirs(variable)
    Bases: object
    Class to bind a specific EPATH variable name to a function that will return all of the EPATH directories.

SCons.Scanner.Scanner(function, *args, **kw)
Factory function to create a Scanner Object.
Creates the appropriate Scanner based on the type of “function”.
TODO: Deprecate this some day. We’ve moved the functionality inside the Base class and really don’t need this factory function any more. It was, however, used by some of our Tool modules, so the call probably ended up in various people’s custom modules patterned on SCons code.

class SCons.Scanner.Selector(dict, *args, **kw)
    Bases: SCons.Scanner.Base
    A class for selecting a more specific scanner based on the scanner_key() (suffix) for a specific Node.
    TODO: This functionality has been moved into the inner workings of the Base class, and this class will be deprecated at some point. (It was never exposed directly as part of the public interface, although it is used by the Scanner() factory function that was used by various Tool modules and therefore was likely a template for custom modules that may be out there.)

    __recurse_all_nodes(nodes)

    __recurse_no_nodes(nodes)

    add_scanner(skey, scanner)

    add_skey(skey)
        Add a skey to the list of skeys

    get_skeys(env=None)
SCons.Script package

```python
path (env, dir=None, target=None, source=None)

select (node)
```

SCons.Scanner._Null

```python
class SCons.Scanner._Null
    Bases: object

SCons.Scanner._null
    alias of SCons.Scanner._Null
```

SCons.Script package

Submodules

SCons.Script.Interactive module

SCons interactive mode.

```python
class SCons.Script.Interactive.SConsInteractiveCmd (**kw)
    Bases: cmd.Cmd

build [TARGETS] Build the specified TARGETS and their dependencies. 'b' is a synonym. clean [TARGETS]
    Clean (remove) the specified TARGETS and their dependencies. 'c' is a synonym. exit Exit SCons interactive
    mode. help [COMMAND] Prints help for the specified COMMAND. 'h' and '?' are synonyms. shell
    [COMMANDLINE] Execute COMMANDLINE in a subshell. 'sh' and '!' are synonyms. version Prints SCons version
    information.

    _do_one_help (arg)

    _doc_to_help (obj)

    _strip_initial_spaces (s)

    cmdloop (intro=None)
        Repeatedly issue a prompt, accept input, parse an initial prefix off the received input, and dispatch to action
        methods, passing them the remainder of the line as argument.

    columnize (list, displaywidth=80)
        Display a list of strings as a compact set of columns.
        Each column is only as wide as necessary. Columns are separated by two spaces (one was not legible enough).

    complete (text, state)
        Return the next possible completion for 'text'.
        If a command has not been entered, then complete against command list. Otherwise try to call
        complete_<command> to get list of completions.

    complete_help (*args)

    completedefault (*ignored)
        Method called to complete an input line when no command-specific complete_*() method is available.
        By default, it returns an empty list.

    completenames (text, *ignored)

    default (argv)
        Called on an input line when the command prefix is not recognized.
        If this method is not overridden, it prints an error message and returns.

    do_EOF (argv)
```
SCons.Script package

```python
do_build (argv)
build [TARGETS] Build the specified TARGETS and their dependencies. ‘b’ is a synonym.

do_clean (argv)
clean [TARGETS] Clean (remove) the specified TARGETS and their dependencies. ‘c’ is a synonym.

do_exit (argv)
exit Exit SCons interactive mode.

do_help (argv)
help [COMMAND] Prints help for the specified COMMAND. ‘h’ and ‘?’ are synonyms.

do_shell (argv)
shell [COMMANDLINE] Execute COMMANDLINE in a subshell. ‘sh’ and ‘!’ are synonyms.

do_version (argv)
version Prints SCons version information.
doc_header = 'Documented commands (type help <topic>):'
doc_leader = ''
emptyline ()
    Called when an empty line is entered in response to the prompt.
    If this method is not overridden, it repeats the last nonempty command entered.
get_names ()
identchars = 'abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789_'
intro = None
lastcmd = ''
misc_header = 'Miscellaneous help topics:'
nohelp = '''No help on %s''
onecmd (line)
    Interpret the argument as though it had been typed in response to the prompt.
    This may be overridden, but should not normally need to be; see the precmd() and postcmd() methods for useful
    execution hooks. The return value is a flag indicating whether interpretation of commands by the interpreter
    should stop.
parseline (line)
    Parse the line into a command name and a string containing the arguments. Returns a tuple containing
    (command, args, line). ‘command’ and ‘args’ may be None if the line couldn’t be parsed.
postcmd (stop, line)
    Hook method executed just after a command dispatch is finished.
postloop ()
    Hook method executed once when the cmdloop() method is about to return.
precmd (line)
    Hook method executed just before the command line is interpreted, but after the input prompt is generated and
    issued.
preloop ()
    Hook method executed once when the cmdloop() method is called.
```
**print_topics** (header, cmds, cmdlen, maxcol)

**prompt** = 'Cmd'

**ruler** = '='

**synonyms** = {'b': 'build', 'c': 'clean', 'h': 'help', 'scons': 'build', 'sh': 'shell'}

**undoc_header** = 'Undocumented commands:'

**use_rawinput** = 1

SCons.Script.Interactive.interact (fs, parser, options, targets, target_top)

---

**SCons.Script.Main module**

The main() function used by the scons script.

Architecturally, this *is* the scons script, and will likely only be called from the external “scons” wrapper. Consequently, anything here should not be, or be considered, part of the build engine. If it’s something that we expect other software to want to use, it should go in some other module. If it’s specific to the “scons” script invocation, it goes here.

SCons.Script.Main.AddOption (**args, **kw)

**class** SCons.Script.Main.BuildTask (tm, targets, top, node)

  Bases: SCons.Taskmaster.OutOfDateTask

  An SCons build task.

    _abc_impl = <_abc_data object>

    _exception_raise ()
    　 Raises a pending exception that was recorded while getting a Task ready for execution.

    _no_exception_to_raise ()

    display (message)
    　 Hook to allow the calling interface to display a message.
    　 This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out what Node should be built next, the actual target list may be altered, along with a message describing the alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see those messages.

    do_failed (status=2)

    exc_clear ()
    　 Clears any recorded exception.
    　 This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

    exc_info ()
    　 Returns info about a recorded exception.

    exception_set (exception=None)
    　 Records an exception to be raised at the appropriate time.
    　 This also changes the “exception_raise” attribute to point to the method that will, in fact

    execute ()
    　 Called to execute the task.
    　 This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread unsafe stuff in prepare(), executed() or failed().

    executed ()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_with_callbacks()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call “visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target was an actual built target or a source Node.

executed_without_callbacks()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the Node’s callback methods.

fail_continue()
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Make a task ready for execution

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons -c” option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Returns True (indicating this Task should be executed) if this Task’s target state indicates it needs executing, which has already been determined by an earlier up-to-date check.

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.
prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary
directories before the Action is actually called to build the targets.

trace_message (method, node, description='node')
class SCons.Script.Main.CleanTask (tm, targets, top, node)
Bases: SCons.Taskmaster.AlwaysTask
An SCons clean task.

_abc_impl = <_abc_data object>

_clean_targets (remove=True)
_exception_raise ()
Raises a pending exception that was recorded while getting a Task ready for execution.

_get_files_to_clean ()

_no_exception_to_raise ()
display (message)
Hook to allow the calling interface to display a message.
This hook gets called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out
what Node should be built next, the actual target list may be altered, along with a message describing the
alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see
those messages.

exc_clear ()
Clears any recorded exception.
This also changes the "exception_raise" attribute to point to the appropriate do-nothing method.

exc_info ()
Returns info about a recorded exception.

exception_set (exception=None)
Records an exception to be raised at the appropriate time.
This also changes the "exception_raise" attribute to point to the method that will, in fact

execute ()
Called to execute the task.
This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
unsafe stuff in prepare(), executed() or failed().

executed ()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
Node’s callback methods.

executed_with_callbacks ()
Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
callback methods.
This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
“visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
was an actual built target or a source Node.

executed_without_callbacks ()
Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
Node’s callback methods.
Explicit continue-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

**fs_delete (path, pathstr, remove=True)**

Fetch the target being built or updated by this task.

**make_ready ()**
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons -c” option.

**make_ready_all ()**
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the “scons -c” option.

**make_ready_current ()**
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

**needs_execute ()**
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t. their dependencies) can use this as follows:

```python
class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute
```

**postprocess ()**
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

**prepare ()**
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

**remove ()**

**show ()**

**trace_message (method, node, description='node')**
SCons.Script package

```python
class SCons.Script.Main.CountStats:
    do_append(label)
    do_nothing(*args,**kw)
    do_print()
    enable(outfp)

class SCons.Script.Main.FakeOptionParser:
    Bases: object
    A do-nothing option parser, used for the initial OptionsParser variable.
    During normal SCons operation, the OptionsParser is created right away by the main() function. Certain tests
    scripts however, can introspect on different Tool modules, the initialization of which can try to add a new, local
    option to an otherwise uninitialized OptionsParser object. This allows that introspection to happen without blowing
    up.

    class FakeOptionValues:
        Bases: object
        add_local_option(*args,**kw)

        values = <SCons.Script.Main.FakeOptionParser.FakeOptionValues object>

SCons.Script.Main.GetBuildFailures()
SCons.Script.Main.GetOption(name)

class SCons.Script.Main.MemStats:
    do_append(label)
    do_nothing(*args,**kw)
    do_print()
    enable(outfp)

SCons.Script.Main.PrintHelp(file=None)
SCons.Script.Main.Progress(*args,**kw)

class SCons.Script.Main.Progressor(obj, interval=1, file=None, overwrite=False):
    Bases: object
    count = 0
    erase_previous()
    prev = ''
    replace_string(node)
    spinner(node)
    string(node)
    target_string = '$TARGET'
    write(s)
```
class SCons.Script.Main.QuestionTask(tm, targets, top, node)
Bases: SCons.Taskmaster.AlwaysTask
An SCons task for the -q (question) option.

_ABC_IMPL = <_abc_data object>

_exception_raise()
    Raises a pending exception that was recorded while getting a Task ready for execution.

_no_exception_to_raise()

display (message)
    Hook to allow the calling interface to display a message.
    This hook is called as part of preparing a task for execution (that is, a Node to be built). As part of figuring out
    what Node should be built next, the actual target list may be altered, along with a message describing the
    alteration. The calling interface can subclass Task and provide a concrete implementation of this method to see
    those messages.

_exc_clear()
    Clears any recorded exception.
    This also changes the “exception_raise” attribute to point to the appropriate do-nothing method.

_exc_info()
    Returns info about a recorded exception.

_exception_set (exception=None)
    Records an exception to be raised at the appropriate time.
    This also changes the “exception_raise” attribute to point to the method that will, in fact

execute()
    Called to execute the task.
    This method is called from multiple threads in a parallel build, so only do thread safe stuff here. Do thread
    unsafe stuff in prepare(), executed() or failed().

executed()
    Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
    callback methods.
    This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
“visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
was an actual built target or a source Node.

executed_with_callbacks()
    Called when the task has been successfully executed and the Taskmaster instance wants to call the Node’s
    callback methods.
    This may have been a do-nothing operation (to preserve build order), so we must check the node’s state before
deciding whether it was “built”, in which case we call the appropriate Node method. In any event, we always call
“visited()”, which will handle any post-visit actions that must take place regardless of whether or not the target
was an actual built target or a source Node.

executed_without_callbacks()
    Called when the task has been successfully executed and the Taskmaster instance doesn’t want to call the
    Node’s callback methods.

fail_continue()
    Explicit continue-the-build failure.
    This sets failure status on the target nodes and all of their dependent parent nodes.
    Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on
up-to-date nodes when using Configure().

fail_stop()
Explicit stop-the-build failure.
This sets failure status on the target nodes and all of their dependent parent nodes.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

failed()
Default action when a task fails: stop the build.
Note: Although this function is normally invoked on nodes in the executing state, it might also be invoked on up-to-date nodes when using Configure().

get_target()
Fetch the target being built or updated by this task.

make_ready()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

make_ready_all()
Marks all targets in a task ready for execution.
This is used when the interface needs every target Node to be visited—the canonical example being the "scons -c" option.

make_ready_current()
Marks all targets in a task ready for execution if any target is not current.
This is the default behavior for building only what’s necessary.

needs_execute()
Always returns True (indicating this Task should always be executed).
Subclasses that need this behavior (as opposed to the default of only executing Nodes that are out of date w.r.t. their dependencies) can use this as follows:

class MyTaskSubclass(SCons.Taskmaster.Task):
    needs_execute = SCons.Taskmaster.AlwaysTask.needs_execute

postprocess()
Post-processes a task after it’s been executed.
This examines all the targets just built (or not, we don’t care if the build was successful, or even if there was no build because everything was up-to-date) to see if they have any waiting parent Nodes, or Nodes waiting on a common side effect, that can be put back on the candidates list.

prepare()
Called just before the task is executed.
This is mainly intended to give the target Nodes a chance to unlink underlying files and make all necessary directories before the Action is actually called to build the targets.

trace_message(method, node, description='node')

exception SCons.Script.Main.SConsPrintHelpException
Bases: Exception

args

with_traceback()
Exception.with_traceback(tb) -- set self.__traceback__ to tb and return self.

SCons.Script.Main.SetOption(name, value)

class SCons.Script.Main.Stats
Bases: object

do_nothing(*args, **kw)
enable (outfp)

class SCons.Script.Main.TreePrinter (derived=False, prune=False, status=False, sLineDraw=False)
   Bases: object

display ()

get_all_children (node)

get_derived_children (node)

SCons.Script.Main._SConstruct_exists (dirname='', repositories=[], filelist=None)
   This function checks that an SConstruct file exists in a directory. If so, it returns the path of the file. By default, it checks the current directory.

SCons.Script.Main._build_targets (fs, options, targets, target_top)

SCons.Script.Main._create_path (plist)

SCons.Script.Main._exec_main (parser, values)

SCons.Script.Main._load_all_site_scons_dirs (topdir, verbose=False)
   Load all of the predefined site_scons dir. Order is significant; we load them in order from most generic (machine-wide) to most specific (topdir). The verbose argument is only for testing.

SCons.Script.Main._load_site_scons_dir (topdir, site_dir_name=None)
   Load the site directory under topdir.
   If a site dir name is supplied use it, else use default "site_scons" Prepend site dir to sys.path. If a "site_tools" subdir exists, prepend to toolpath. Import "site_init.py" from site dir if it exists.

SCons.Script.Main._main (parser)

SCons.Script.Main._scons_internal_error ()
   Handle all errors but user errors. Print out a message telling the user what to do in this case and print a normal trace.

SCons.Script.Main._scons_internal_warning (e)
   Slightly different from _scons_user_warning in that we use the current call stack rather than sys.exc_info() to get our stack trace. This is used by the warnings framework to print warnings.

SCons.Script.Main._scons_syntax_error (e)
   Handle syntax errors. Print out a message and show where the error occurred.

SCons.Script.Main._scons_user_error (e)
   Handle user errors. Print out a message and a description of the error, along with the line number and routine where it occurred. The file and line number will be the deepest stack frame that is not part of SCons itself.

SCons.Script.Main._scons_user_warning (e)
   Handle user warnings. Print out a message and a description of the warning, along with the line number and routine where it occurred. The file and line number will be the deepest stack frame that is not part of SCons itself.

SCons.Script.Main._set_debug_values (options)

SCons.Script.Main.find_deepest_user_frame (tb)
   Find the deepest stack frame that is not part of SCons.
   Input is a "pre-processed" stack trace in the form returned by traceback.extract_tb() or traceback.extract_stack()

SCons.Script.Main.main ()

SCons.Script.Main.path_string (label, module)

SCons.Script.Main.python_version_deprecated (version=sys.version_info(major=3, minor=7, micro=11, releaselevel='final', serial=0))

SCons.Script.Main.python_version_string ()

SCons.Script.Main.python_version_unsupported (version=sys.version_info(major=3, minor=7, micro=11, releaselevel='final', serial=0))

SCons.Script.Main.revert_io ()
SCons.Script package

SCons.Script.Main.test_load_all_site_scons_dirs (d)
SCons.Script.Main.version_string (label, module)

**SCons.Script.SConsOptions module**

SCons.Script.SConsOptions.Parser (version)
Returns an options parser object initialized with the standard SCons options.

class SCons.Script.SConsOptions.SConsIndentedHelpFormatter (indent_increment=2, max_help_position=24, width=None, short_first=1)
Bases: optparse.IndentedHelpFormatter

NO_DEFAULT_VALUE = 'none'

_format_text (text)
Format a paragraph of free-form text for inclusion in the help output at the current indentation level.

dedent ()

expand_default (option)

format_description (description)

format_epilog (epilog)

format_heading (heading)
This translates any heading of “options” or “Options” into “SCons Options.” Unfortunately, we have to do this here, because those titles are hard-coded in the optparse calls.

format_option (option)
A copy of the normal optparse.IndentedHelpFormatter.format_option() method. This has been snarfed so we can modify text wrapping to out liking:

– add our own regular expression that doesn’t break on hyphens
  (so things like –no-print-directory don’t get broken);
– wrap the list of options themselves when it’s too long
  (the wrapper.fill(opts) call below);
– set the subsequent_indent when wrapping the help_text.

format_option_strings (option)
Return a comma-separated list of option strings & metavariables.

format_usage (usage)

indent ()

set_long_opt_delimiter (delim)

set_parser (parser)

set_short_opt_delimiter (delim)

store_option_strings (parser)

class SCons.Script.SConsOptions.SConsOption (*opts, **attrs)
Bases: optparse.Option

ACTIONS = ('store', 'store_const', 'store_true', 'store_false', 'append', 'append_const', 'count', 'callback', 'help', 'version')
ALWAYS_TYPED_ACTIONS = ('store', 'append')

ATTRS = ['action', 'type', 'dest', 'default', 'nargs', 'const', 'choices', 'callback', 'callback_args', 'callback_kwars', 'help', 'metavar']

CHECK_METHODS = [
    Option._check_action, Option._check_type, Option._check_choice, Option._check_dest,
    Option._check_const, Option._check_nargs, Option._check_callback, SConsOption._check_nargs_optional,
]

CONST_ACTIONS = ('store_const', 'append_const', 'store', 'append', 'callback')

STORE_ACTIONS = ('store', 'store_const', 'store_true', 'store_false', 'append', 'append_const', 'count')

_set_opt_strings(opts)

check_value(opt, value)

convert_value(opt, value)

gopt_string(opt, value)

process(opt, value, values, parser)

take_action(action, dest, opt, value, values, parser)

takes_value()

class SCons.Script.SConsOptions.SConsOptionGroup (parser, title, description=None)
Bases: optparse.OptionGroup
A subclass for SCons-specific option groups.
The only difference between this and the base class is that we print the group's help text flush left, underneath their own title but lined up with the normal "SCons Options".

_check_conflict (option)
_create_option_list()

_create_option_mappings()

_share_option_mappings(parser)

add_option(Option)
    add_option(opt_str, ..., kwarg=val, ...)

add_options(option_list)

destroy()
    see OptionParser.destroy().

format_description(formatter)

format_help(formatter)
    Format an option group's help text, outdenting the title so it's flush with the “SCons Options” title we print at the top.

format_option_help(formatter)

get_description()

get_option(opt_str)

has_option(opt_str)

remove_option(opt_str)

set_conflict_handler(handler)

set_description(description)

set_title(title)

class SCons.Script.SConsOptions.SConsOptionParser (usage=None, option_list=None, option_class=<class 'optparse.Option'>, version=None, conflict_handler='error', description=None, formatter=None, add_help_option=True, prog=None, epilog=None)
    Bases: optparse.OptionParser

_add_help_option()

_add_version_option()

_check_conflict(option)

_create_option_list()

_create_option_mappings()

_get_all_options()

_get_args(args)

_init_parsing_state()

_match_long_opt(opt: string) → string
    Determine which long option string ‘opt’ matches, ie. which one it is an unambiguous abbreviation for. Raises BadOptionError if ‘opt’ doesn’t unambiguously match any long option string.
_populate_option_list (option_list, add_help=True)

_process_args (largs, rargs, values)
_process_args(largs : [string], 
     rargs : [string], values : Values)
Process command-line arguments and populate ‘values’, consuming options and arguments from ‘rargs’. If ‘allow_interspersed_args’ is false, stop at the first non-option argument. If true, accumulate any interspersed non-option arguments in ‘largs’.

_process_long_opt (rargs, values)
SCons-specific processing of long options.
This is copied directly from the normal optparse._process_long_opt() method, except that, if configured to do so, we catch the exception thrown when an unknown option is encountered and just stick it back on the “leftover” arguments for later (re-)processing.

_process_short_opts (rargs, values)

_share_option_mappings (parser)

add_local_option (*args, **kw)
Adds a local option to the parser.
This is initiated by an AddOption() call to add a user-defined command-line option. We add the option to a separate option group for the local options, creating the group if necessary.

add_option (Option)
add_option(opt_str, ..., kwarg=val, ...) 

add_option_group (*args, **kwargs)

add_options (option_list)

check_values (values: Values, args: [string])
-> (values : Values, args : [string])
Check that the supplied option values and leftover arguments are valid. Returns the option values and leftover arguments (possibly adjusted, possibly completely new – whatever you like). Default implementation just returns the passed-in values; subclasses may override as desired.

destroy ()
Declare that you are done with this OptionParser. This cleans up reference cycles so the OptionParser (and all objects referenced by it) can be garbage-collected promptly. After calling destroy(), the OptionParser is unusable.

disable_interspersed_args ()
Set parsing to stop on the first non-option. Use this if you have a command processor which runs another command that has options of its own and you want to make sure these options don’t get confused.

enable_interspersed_args ()
Set parsing to not stop on the first non-option, allowing interspersing switches with command arguments. This is the default behavior. See also disable_interspersed_args() and the class documentation description of the attribute allow_interspersed_args.

error (msg: string)
Print a usage message incorporating ‘msg’ to stderr and exit. If you override this in a subclass, it should not return – it should either exit or raise an exception.

exit (status=0, msg=None)

expand_prog_name(s)

format_description (formatter)
SCons.Script package

format_epilog (formatter)
format_help (formatter=None)
format_option_help (formatter=None)

has_option (opt_str)

parse_args (args=None, values=None)
    parse_args[ args : [string] = sys.argv[1:],
                values : Values = None]
        -> (values : Values, args : [string])
    Parse the command-line options found in ‘args’ (default: sys.argv[1:]) . Any errors result in a call to ‘error()’, which by default prints the usage message to stderr and calls sys.exit() with an error message. On success returns a pair (values, args) where ‘values’ is a Values instance (with all your option values) and ‘args’ is the list of arguments left over after parsing options.

preserve_unknown_options = False

print_help (file: file = stdout)
    Print an extended help message, listing all options and any help text provided with them, to ‘file’ (default stdout).

print_usage (file: file = stdout)
    Print the usage message for the current program (self.usage) to ‘file’ (default stdout). Any occurrence of the string “%prog” in self.usage is replaced with the name of the current program (basename of sys.argv[0]). Does nothing if self.usage is empty or not defined.

print_version (file: file = stdout)
    Print the version message for this program (self.version) to ‘file’ (default stdout). As with print_usage(), any occurrence of “%prog” in self.version is replaced by the current program’s name. Does nothing if self.version is empty or undefined.

remove_option (opt_str)

reparse_local_options ()
    Re-parse the leftover command-line options.
    Parse options stored in self.largs, so that any value overridden on the command line is immediately available if
    the user turns around and does a GetOption() right away.
    We mimic the processing of the single args in the original OptionParser .process_args(), but here we allow
    exact matches for long-opts only (no partial argument names!). Otherwise there could be problems in
    add_local_option() below. When called from there, we try to reparse the command-line arguments that
    1. haven’t been processed so far (self.largs), but
    2. are possibly not added to the list of options yet.
    So, when we only have a value for “-myargument” so far, a command-line argument of “-myarg=test” would set
    it, per the behaviour of .match_long_opt(), which allows for partial matches of the option name, as long as
the common prefix appears to be unique. This would lead to further confusion, because we might want to add another option “--myarg” later on (see issue #2929).

```
set_conflict_handler (handler)
set_default (dest, value)
set_defaults (**kwargs)
set_description (description)
set_process_default_values (process)
set_usage (usage)
standard_option_list = []
```

class SCons.Script.SConsOptions.SConsValues (defaults)
Bases: optparse.Values
Holder class for uniform access to SCons options, regardless of whether or not they can be set on the command line or in the SConscript files (using the SetOption() function).
A SCons option value can originate three different ways:

1. set on the command line;
2. set in an SConscript file;
3. the default setting (from the the op.add_option() calls in the Parser() function, below).
The command line always overrides a value set in a SConscript file, which in turn always overrides default settings. Because we want to support user-specified options in the SConscript file itself, though, we may not know about all of the options when the command line is first parsed, so we can’t make all the necessary precedence decisions at the time the option is configured.
The solution implemented in this class is to keep these different sets of settings separate (command line, SConscript file, and default) and to override the __getattr__() method to check them in turn. This should allow the rest of the code to just fetch values as attributes of an instance of this class, without having to worry about where they came from.

Note that not all command line options are settable from SConscript files, and the ones that are must be explicitly added to the “settable” list in this class, and optionally validated and coerced in the set_option() method.

```
_update (dict, mode)
_update_careful (dict)
  Update the option values from an arbitrary dictionary, but only use keys from dict that already have a corresponding attribute in self. Any keys in dict without a corresponding attribute are silently ignored.
_update_loose (dict)
  Update the option values from an arbitrary dictionary, using all keys from the dictionary regardless of whether they have a corresponding attribute in self or not.
ensure_value (attr, value)
read_file (filename, mode='careful')
read_module (modname, mode='careful')
set_option (name, value)
  Sets an option from an SConscript file.
  Raises: UserError – invalid or malformed option (“error in your script”)
SCons.Script package

```python
collectible = ['clean', 'diskcheck', 'duplicate', 'experimental', 'hash_chunksize', 'hash_format', 'help', 'implicit_cache', 'implicit_deps_changed', 'implicit_deps_unchanged', 'max_drift', 'md5_chunksize', 'no_exec', 'no_progress', 'num_jobs', 'random', 'silent', 'stack_size', 'warn', 'disable_execute_ninja', 'disable_ninja']
```

**SCons.Script.SConscript module**

This module defines the Python API provided to SConscript files.

```python
SCons.Script.SConscript.BuildDefaultGlobals()
Create a dictionary containing all the default globals for SConstruct and SConscript files.
```

```python
class SCons.Script.SConscript.DefaultEnvironmentCall(method_name, subst=0)
Bases: object
A class that implements “global function” calls of Environment methods by fetching the specified method from the DefaultEnvironment's class. Note that this uses an intermediate proxy class instead of calling the DefaultEnvironment method directly so that the proxy can override the subst() method and thereby prevent expansion of construction variables (since from the user's point of view this was called as a global function, with no associated construction environment).
```

```python
class SCons.Script.SConscript.Frame(fs, exports, sconscript)
Bases: object
A frame on the SConstruct/SConscript call stack
```

```python
class SCons.Script.SConscript.Return(*vars, **kw)
```

```python
class SCons.Script.SConscript.SConsEnvironment(platform=None, tools=None, toolpath=None, variables=None, parse_flags=None, **kw)
Bases: SCons.Environment.Base
An Environment subclass that contains all of the methods that are particular to the wrapper SCons interface and which aren’t (or shouldn’t be) part of the build engine itself.
Note that not all of the methods of this class have corresponding global functions, there are some private methods.
```

```python
Action(*args, **kw)
AddMethod(function, name=None)
Adds the specified function as a method of this construction environment with the specified name. If the name is omitted, the default name is the name of the function itself.
AddPostAction(files, action)
AddPreAction(files, action)
Alias(target, source=[], action=None, **kw)
AlwaysBuild(*targets)
Append(**kw)
Append values to construction variables in an Environment.
The variable is created if it is not already present.
AppendENVPath(name, newpath, envname='ENV', sep=':', delete_existing=0)
Append path elements to the path 'name' in the 'ENV' dictionary for this environment. Will only add any particular path once, and will normpath and normcase all paths to help assure this. This can also handle the case where the env variable is a list instead of a string.
If delete_existing is 0, a newpath which is already in the path will not be moved to the end (it will be left where it is).
AppendUnique(delete_existing=0, **kw)
```
Append values to existing construction variables in an Environment, if they’re not already there. If delete_existing is 1, removes existing values first, so values move to end.

Builder (**kw)

CacheDir (path, custom_class=None)

Clean (targets, files)

Clone (tools=[], toolpath=None, parse_flags=None, **kw)
   Return a copy of a construction Environment.
   The copy is like a Python “deep copy”—that is, independent copies are made recursively of each objects—except that a reference is copied when an object is not deep-copyable (like a function). There are no references to any mutable objects in the original Environment.

Command (target, source, action, **kw)
   Builds the supplied target files from the supplied source files using the supplied action. Action may be any type that the Builder constructor will accept for an action.

Configure (*args, **kw)

Decider (function)

Default (*targets)

Depends (target, dependency)
   Explicitly specify that ‘target’s depend on ‘dependency’.

Detect (progs)
   Return the first available program from one or more possibilities.

   Parameters:  progs (str or list) – one or more command names to check for

Dictionary (*args)
   Return construction variables from an environment.

   Parameters:  *args (optional) – variable names to look up
       Returns:  If args omitted, the dictionary of all construction variables. If one arg, the corresponding value is returned. If more than one arg, a list of values is returned.
       Raises:  KeyError – if any of args is not in the construction environment.

Dir (name, *args, **kw)

Dump (key=None, format='pretty')
   Return construction variables serialized to a string.

   Parameters:
       • key (optional) – if None, format the whole dict of variables. Else format the value of key (Default value = None)
       • format (str, optional) – specify the format to serialize to. “pretty” generates a pretty-printed string, “json” a JSON-formatted string. (Default value = “pretty”)

EnsurePythonVersion (major, minor)
   Exit abnormally if the Python version is not late enough.

EnsureSConsVersion (major, minor, revision=0)
   Exit abnormally if the SCons version is not late enough.

Entry (name, *args, **kw)

Environment (**kw)
SCons.Script package

`Execute(action, *args, **kw)`
Directly execute an action through an Environment

`Exit(value=0)`

`Export(*vars, **kw)`

`File(name, *args, **kw)`

`FindFile(file, dirs)`

`FindInstalledFiles()`
returns the list of all targets of the Install and InstallAs Builder.

`FindIxes(paths, prefix, suffix)`
Search a list of paths for something that matches the prefix and suffix.

Parameters:
- `paths` – the list of paths or nodes.
- `prefix` – construction variable for the prefix.
- `suffix` – construction variable for the suffix.

Returns: the matched path or None

`FindSourceFiles(node= '.')`
returns a list of all source files.

`Flatten(sequence)`

`GetBuildPath(files)`

`GetLaunchDir()`

`GetOption(name)`

`Glob(pattern, ondisk=True, source=False, strings=False, exclude=None)`

`Help(text, append=False)`

`Ignore(target, dependency)`
Ignore a dependency.

`Import(*vars)`

`Literal(string)`

`Local(*targets)`

`MergeFlags(args, unique=True)`
Merge flags into construction variables.
Merges the flags from `args` into this construction environment. If `args` is not a dict, it is first converted to a dictionary with flags distributed into appropriate construction variables. See `ParseFlags()`.

Parameters:
- `args` – flags to merge
- `unique` – merge flags rather than appending (default: True)

`NoCache(*targets)`
Tags a target so that it will not be cached

`NoClean(*targets)`
Tags a target so that it will not be cleaned by `-c`
Override (overrides)
Produce a modified environment whose variables are overridden by the overrides dictionaries. “overrides” is a
dictionary that will override the variables of this environment.
This function is much more efficient than Clone() or creating a new Environment because it doesn’t copy the
construction environment dictionary, it just wraps the underlying construction environment, and doesn’t even
create a wrapper object if there are no overrides.

ParseConfig (command, function=None, unique=True)
Use the specified function to parse the output of the command in order to modify the current environment. The
‘command’ can be a string or a list of strings representing a command and its arguments. ‘Function’ is an
optional argument that takes the environment, the output of the command, and the unique flag. If no function is
specified, MergeFlags, which treats the output as the result of a typical ‘X-config’ command (i.e. gtk-config), will
merge the output into the appropriate variables.

ParseDepends (filename, must_exist=None, only_one=False)
Parse a mkdep-style file for explicit dependencies. This is completely abusable, and should be unnecessary in
the “normal” case of proper SCons configuration, but it may help make the transition from a Make hierarchy
easier for some people to swallow. It can also be genuinely useful when using a tool that can write a .d file, but
for which writing a scanner would be too complicated.

ParseFlags ("flags")
Return a dict of parsed flags.
Parse flags and return a dict with the flags distributed into the appropriate construction variable names. The
flags are treated as a typical set of command-line flags for a GNU-like toolchain, such as might have been
generated by one of the (foo)-config scripts, and used to populate the entries based on knowledge embedded in
this method - the choices are not expected to be portable to other toolchains.
If one of the flags strings begins with a bang (exclamation mark), it is assumed to be a command and the rest
of the string is executed; the result of that evaluation is then added to the dict.

Platform (platform)

Precious (*targets)

Prepend (**kw)
Prepend values to construction variables in an Environment.
The variable is created if it is not already present.

PrependENVPath (name, newpath, envname='ENV', sep=':', delete_existing=1)
Prepend path elements to the path ‘name’ in the ‘ENV’ dictionary for this environment. Will only add any
particular path once, and will normpath and normcase all paths to help assure this. This can also handle the
case where the env variable is a list instead of a string.
If delete_existing is 0, a newpath which is already in the path will not be moved to the front (it will be left where it
is).

PrependUnique (delete_existing=0, **kw)
Prepend values to existing construction variables in an Environment, if they’re not already there. If
delete_existing is 1, removes existing values first, so values move to front.

Pseudo (*targets)

PyPackageDir (modulename)

RemoveMethod (function)
Removes the specified function’s MethodWrapper from the added_methods list, so we don’t re-bind it when
making a clone.

Replace (**kw)
Replace existing construction variables in an Environment with new construction variables and/or values.

ReplaceIxes (path, old_prefix, old_suffix, new_prefix, new_suffix)
Replace old_prefix with new_prefix and old_suffix with new_suffix.
env - Environment used to interpolate variables. path - the path that will be modified. old_prefix - construction variable for the old prefix. old_suffix - construction variable for the old suffix. new_prefix - construction variable for the new prefix. new_suffix - construction variable for the new suffix.

Repository (*dirs, **kw)

Requires (target, prerequisite)
Specify that ‘prerequisite’ must be built before ‘target’, (but ‘target’ does not actually depend on ‘prerequisite’ and need not be rebuilt if it changes).

SConscript (*ls, **kw)
Execute SCons configuration files.

Parameters:  *ls (str or list) – configuration file(s) to execute.

Keyword Arguments:

- dirs (list) – execute SConscript in each listed directory.
- name (str) – execute script ‘name’ (used only with ‘dirs’).
- exports (list or dict) – locally export variables the called script(s) can import.
- variant_dir (str) – mirror sources needed for the build in a variant directory to allow building in it.
- duplicate (bool) – physically duplicate sources instead of just adjusting paths of derived files (used only with ‘variant_dir’) (default is True).
- must_exist (bool) – fail if a requested script is missing (default is False, default is deprecated).

Returns:  list of variables returned by the called script

Raises:  UserError – a script is not found and such exceptions are enabled.

SConscriptChdir (flag)

SConsignFile (name='.sconsign', dbm_module=None)

Scanner (*args, **kw)

SetDefault (**kw)

SetOption (name, value)

SideEffect (side_effect, target)
Tell scons that side_effects are built as side effects of building targets.

Split (arg)
This function converts a string or list into a list of strings or Nodes. This makes things easier for users by allowing files to be specified as a white-space separated list to be split.

The input rules are:

- A single string containing names separated by spaces. These will be split apart at the spaces.
- A single Node instance
- A list containing either strings or Node instances. Any strings in the list are not split at spaces. In all cases, the function returns a list of Nodes and strings.

Tool (tool, toolpath=None, **kwargs) → SCons.Tool.Tool

Value (value, built_value=None, name=None)

VariantDir (variant_dir, src_dir, duplicate=1)

WhereIs (prog, path=None, pathext=None, reject=None)
Find prog in the path.

_canonicalize(path)
   Allow Dirs and strings beginning with # for top-relative.
   Note this uses the current env's fs (in self).

_changed_build(dependency, target, prev_ni, repo_node=None)
_changed_content(dependency, target, prev_ni, repo_node=None)
_changed_source(dependency, target, prev_ni, repo_node=None)
_changed_timestamp_match(dependency, target, prev_ni, repo_node=None)
_changed_timestamp_newer(dependency, target, prev_ni, repo_node=None)
_changed_timestamp_then_content(dependency, target, prev_ni, repo_node=None)
_exceeds_version(major, minor, v_major, v_minor)
   Return 1 if 'major' and 'minor' are greater than the version in 'v_major' and 'v_minor', and 0 otherwise.

_find_toolpath_dir(tp)

_get_SConscript_filenames(ls, kw)
   Convert the parameters passed to SConscript() calls into a list of files and export variables. If the parameters are invalid, throws SCons.Errors.UserError. Returns a tuple (l, e) where l is a list of SConscript filenames and e is a list of exports.

_get_major_minor_revision(version_string)
   Split a version string into major, minor and (optionally) revision parts.
   This is complicated by the fact that a version string can be something like 3.2b1.

gsm()

_init_special()
   Initial the dispatch tables for special handling of special construction variables.

_update(other)
   Private method to update an environment's consvar dict directly.
   Bypasses the normal checks that occur when users try to set items.

_update_onlynew(other)
   Private method to add new items to an environment's consvar dict.
   Only adds items from other whose keys do not already appear in the existing dict; values from other are not used for replacement. Bypasses the normal checks that occur when users try to set items.

arg2nodes(args, node_factory=<class 'SCons.Environment._Null'>, lookup_list=<class 'SCons.Environment._Null'>,**kw)

backtick(command)

get(key, default=None)
   Emulates the get() method of dictionaries.

get_CacheDir()

get_builder(name)
   Fetch the builder with the specified name from the environment.

get_factory(factory, default='File')
   Return a factory function for creating Nodes for this construction environment.
SCons.Script package

get_scanner (skey)
Find the appropriate scanner given a key (usually a file suffix).

get_src_sig_type ()

get_tgt_sig_type ()
gvars ()
items ()
Emulates the items() method of dictionaries.

keys ()
Emulates the keys() method of dictionaries.
lvars ()

scanner_map_delete (kw=None)
Delete the cached scanner map (if we need to).

setdefault (key, default=None)
Emulates the setdefault() method of dictionaries.

subst (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

subst_kw (kw, raw=0, target=None, source=None)

subst_list (string, raw=0, target=None, source=None, conv=None, executor=None)
Calls through to SCons.Subst.scons_subst_list(). See the documentation for that function.

subst_path (path, target=None, source=None)
Substitute a path list, turning EntryProxies into Nodes and leaving Nodes (and other objects) as-is.

subst_target_source (string, raw=0, target=None, source=None, conv=None, executor=None)
Recursively interpolates construction variables from the Environment into the specified string, returning the expanded result. Construction variables are specified by a $ prefix in the string and begin with an initial underscore or alphabetic character followed by any number of underscores or alphanumeric characters. The construction variable names may be surrounded by curly braces to separate the name from trailing characters.

validate_CacheDir_class (custom_class=None)
Validate the passed custom CacheDir class, or if no args are passed, validate the custom CacheDir class from the environment.

values ()
Emulates the values() method of dictionaries.

exception SCons.Script.SConscript.SConscriptReturn
Bases: Exception

args

with_traceback ()
Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

SCons.Script.SConscript.SConscript_exception(file=_io.TextIOWrapper name='<stderr>' mode='w' encoding='utf-8'>)
Print an exception stack trace just for the SConscript file(s). This will show users who have Python errors where
the problem is, without cluttering the output with all of the internal calls leading up to where we exec the
SConscript.

```python
SCons.Script.SConscript._SConscript(fs, *files, **kw)
```

Annotate a node with the stack frame describing the SConscript file and line number that created it.

```python
SCons.Script.SConscript.annotate(node)
```

Annotate a node with the stack frame describing the SConscript file and line number that created it.

```python
SCons.Script.SConscript.compute_exports(exports)
```

Compute a dictionary of exports given one of the parameters to the Export() function or the exports argument to
SConscript().

```python
SCons.Script.SConscript.get_DefaultEnvironmentProxy()
```

Return the locals and globals for the function that called into this module in the current call stack.

```python
SCons.Script.SConscript.handle_missing_SConscript(f, must_exist=None)
```

Take appropriate action on missing file in SConscript() call.

Print a warning or raise an exception on missing file, unless missing is explicitly allowed by the `must_exist` value.
On first warning, print a deprecation message.

```
Parameters:
  • f (str) – path of missing configuration file
  • must_exist (bool) – if true, fail. If false, but not None, allow the file to be missing. The default is None, which means issue the warning. The default is deprecated.

Raises: UserError – if `must_exist` is true or if global `SCons.Script._no_missing_sconscript` is true.
```

## Module contents

The main() function used by the scons script.

Architecturally, this is the scons script, and will likely only be called from the external “scons” wrapper. Consequently,
anything here should not be, or be considered, part of the build engine. If it’s something that we expect other
software to want to use, it should go in some other module. If it’s specific to the “scons” script invocation, it goes
here.

```python
SCons.Script.HelpFunction (text, append=False)
```

```python
class SCons.Script.TargetList (initlist=None)
```

```python
Bases: collections.UserList
```

```python
__abc_impl = <_abc_data object>
```

```python
__add_Default (list)
```

```python
__clear ()
```

```python
__do_nothing (*args, **kw)
```

```python
append (item)
```

```python
S.append(value) – append value to the end of the sequence
```

```python
clear () – None – remove all items from S
```

```python
copy ()
```

```python
count (value) – integer – return number of occurrences of value
```

```python
extend (other)
```

```python
S.extend(iterable) – extend sequence by appending elements from the iterable
```
SCons.Tool package

```python
index(value[, start[, stop]]) → integer – return first index of value.
Raise ValueError if the value is not present.
Supporting start and stop arguments is optional, but recommended.

insert (i, item)
S.insert(index, value) – insert value before index

pop ([i]) → item – remove and return item at index (default last).
Raise IndexError if list is empty or index is out of range.

remove (item)
S.remove(value) – remove first occurrence of value. Raise ValueError if the value is not present.

reverse ()
S.reverse() – reverse IN PLACE

sort (*args, **kwds)
SCons.Script.Variables (files=None, args={})
SCons.Script._Add_Arguments (alist)
SCons.Script._Add_Targets (tlist)
SCons.Script._Get_Default_Targets (d, fs)
SCons.Script._Set_Default_Targets (env, tlist)
SCons.Script._Set_Default_Targets_Has_Been_Called (d, fs)
SCons.Script._Set_Default_Targets_Has_Not_Been_Called (d, fs)
SCons.Script.set_missing_sconscript_error (flag=1)
    Set behavior on missing file in SConscript() call.
    Returns: previous value
```

**Module contents**

SCons.Tool
SCons tool selection.

This looks for modules that define a callable object that can modify a construction environment as appropriate for a given tool (or tool chain).

Note that because this subsystem just selects a callable that can modify a construction environment, it’s possible for people to define their own “tool specification” in an arbitrary callable function. No one needs to use or tie in to this subsystem in order to roll their own tool specifications.

SCons.Tool.CreateJarBuilder (env)
The Jar builder expects a list of class files which it can package into a jar file.
The jar tool provides an interface for passing other types of java files such as .java, directories or swig interfaces and will build them to class files in which it can package into the jar.

SCons.Tool.CreateJavaClassDirBuilder (env)
SCons.Tool.CreateJavaClassFileBuilder (env)
SCons.Tool.CreateJavaFileBuilder (env)
SCons.Tool.CreateJavaHBuilder (env)
SCons.Tool.FindAllTools (tools, env)
SCons.Tool.FindTool (tools, env)
SCons.Tool package

SCons.Tool.Initializers (env)

class SCons.Tool.Tool (name, toolpath=None, **kwargs)
    Bases: object

    _load_dotted_module_py2 (short_name, full_name, searchpaths=None)

    _tool_module ()

class SCons.Tool.ToolInitializer (env, tools, names)
    Bases: object
    A class for delayed initialization of Tools modules.
    Instances of this class associate a list of Tool modules with a list of Builder method names that will be added by
    those Tool modules. As part of instantiating this object for a particular construction environment, we also add the
    appropriate ToolInitializerMethod objects for the various Builder methods that we want to use to delay Tool
    searches until necessary.

    apply_tools (env)
        Searches the list of associated Tool modules for one that exists, and applies that to the construction
        environment.

    remove_methods (env)
        Removes the methods that were added by the tool initialization so we no longer copy and re-bind them when the
        construction environment gets cloned.

class SCons.Tool.ToolInitializerMethod (name, initializer)
    Bases: object
    This is added to a construction environment in place of a method(s) normally called for a Builder (env.Object,
    env.StaticObject, etc.). When called, it has its associated ToolInitializer object search the specified list of tools and
    apply the first one that exists to the construction environment. It then calls whatever builder was (presumably)
    added to the construction environment in place of this particular instance.

    get_builder (env)
        Returns the appropriate real Builder for this method name after having the associated ToolInitializer object apply
        the appropriate Tool module.

SCons.Tool.createCFileBuilders (env)
    This is a utility function that creates the CFile/CXXFile Builders in an Environment if they are not there already.
    If they are there already, we return the existing ones.
    This is a separate function because soooo many Tools use this functionality.
    The return is a 2-tuple of (CFile, CXXFile)

SCons.Tool.createLoadableModuleBuilder (env, loadable_module_suffix='$_LDMODULESUFFIX')
    This is a utility function that creates the LoadableModule Builder in an Environment if it is not there already.
    If it is already there, we return the existing one.

    Parameters:  loadable_module_suffix – The suffix specified for the loadable module builder

SCons.Tool.createObjBuilders (env)
    This is a utility function that creates the StaticObject and SharedObject Builders in an Environment if they are not
    there already.
    If they are there already, we return the existing ones.
    This is a separate function because soooo many Tools use this functionality.
    The return is a 2-tuple of (StaticObject, SharedObject)

SCons.Tool.createProgBuilder (env)
    This is a utility function that creates the Program Builder in an Environment if it is not there already.
    If it is already there, we return the existing one.

SCons.Tool.createSharedLibBuilder (env, shlib_suffix='$_SHLIBSUFFIX')
    This is a utility function that creates the SharedLibrary Builder in an Environment if it is not there already.
    If it is already there, we return the existing one.

    Parameters:  shlib_suffix – The suffix specified for the shared library builder
SCons Tool.

createStaticLibBuilder (env)
This is a utility function that creates the StaticLibary Builder in an Environment if it is not there already. If it is already there, we return the existing one.

SCons Tool.

find_program_path (env, key_program, default_paths=None)
Find the location of a tool using various means.
Mainly for windows where tools aren’t all installed in /usr/bin, etc.

Parameters:
- env – Current Construction Environment.
- key_program – Tool to locate.
- default_paths – List of additional paths this tool might be found in.

SCons Tool.

tool_list (platform, env)

Submodules

SCons Variables package

SCons Variables BoolVariable module
Option type for true/false Variables.
Usage example:

```python
opts = Variables()
opts.Add(BoolVariable('embedded', 'build for an embedded system', 0))
...
if env['embedded'] == 1:
    ...
```

SCons Variables BoolVariable.

BoolVariable (key, help, default)
The input parameters describe a boolean option, thus they are returned with the correct converter and validator appended. The ‘help’ text will by appended by ‘(yes|no) to show the valid valued. The result is usable for input to opts.Add().

SCons Variables BoolVariable.

_text2bool (val)
Converts strings to True/False depending on the ‘truth’ expressed by the string. If the string can’t be converted, the original value will be returned.
See ‘__true_strings’ and ‘__false_strings’ for values considered ‘true’ or ‘false respectively.
This is usable as ‘converter’ for SCons’ Variables.

SCons Variables BoolVariable.

_validator (key, val, env)
Validates the given value to be either ‘0’ or ‘1’.
This is usable as ‘validator’ for SCons’ Variables.

SCons Variables EnumVariable module
Option type for enumeration Variables.
This file defines the option type for SCons allowing only specified input-values.

Usage example:

```python
opts = Variables()
opts.Add(
    EnumVariable(
        'debug',
        'debug output and symbols',
        'no',
        allowed_values=('yes', 'no', 'full'),
        map={},
    )
)`
if env['debug'] == 'full':
    ...

SCons.Variables.EnumVariable

The input parameters describe an option with only certain values allowed. They are returned with an appropriate converter and validator appended. The result is usable for input to Variables.Add().

- 'key' and 'default' are the values to be passed on to Variables.Add().
- 'help' will be appended by the allowed values automatically
- 'allowed_values' is a list of strings, which are allowed as values for this option.
- 'ignorecase' defines the behaviour of the validator:
  - If ignorecase == 0, the validator/converter are case-sensitive. If ignorecase == 1, the validator/converter are case-insensitive. If ignorecase == 2, the validator/converter is case-insensitive and the converted value will always be lower-case.

  The ‘validator’ tests whether the value is in the list of allowed values. The ‘converter’ converts input values according to the given ‘map’-dictionary (unmapped input values are returned unchanged).

SCons Variables.ListVariable

Option type for list Variables.

This file defines the option type for SCons implementing ‘lists’.

A ‘list’ option may either be ‘all’, ‘none’ or a list of names separated by comma. After the option has been processed, the option value holds either the named list elements, all list elements or no list elements at all.

Usage example:

```python
list_of_libs = Split('x11 gl qt ical')

opts = Variables()
opts.Add(
    ListVariable(
        'shared',
        'libraries to build as shared libraries',
        'all',
        elems=list_of_libs,
    )
)
...
for lib in list_of_libs:
    if lib in env['shared']:
        env.SharedObject(...)
    else:
        env.Object(...)
```

SCons.Variables.ListVariable

The input parameters describe a ‘package list’ option, thus they are returned with the correct converter and validator appended. The result is usable for input to opts.Add() .

A ‘package list’ option may either be ‘all’, ‘none’ or a list of package names (separated by space).

SCons.Variables.ListVariable._converter

Option type for package Variables.

This file defines the option type for SCons implementing ‘package activation’.
SCons.Variables package

To be used whenever a ‘package’ may be enabled/disabled and the package path may be specified.

Usage example:

**Examples:**

x11=no (disables X11 support) x11=yes (will search for the package installation dir) x11=/usr/local/X11 (will check this path for existence)

To replace autoconf’s –with-xxx=yyy

```python
opts = Variables()
opts.Add(PackageVariable('x11',
   'use X11 installed here (yes = search some places',
   'yes'))
...
if env['x11'] == True:
   dir = ... search X11 in some standard places ...
   env['x11'] = dir
if env['x11']:
   ... build with x11 ...
```

SCons.Variables.PackgeVariable.PackgeVariable (key, help, default, searchfunc=None)

The input parameters describe a ‘package list’ option, thus they are returned with the correct converter and validator appended. The result is usable for input to opts.Add() .

A ‘package list’ option may either be ‘all’, ‘none’ or a list of package names (separated by space).

SCons.Variables.PackgeVariable._converter (val)
SCons.Variables.PackgeVariable._validator (key, val, env, searchfunc)

---

**SCons.Variables.PathVariable module**

Option type for path Variables.

This file defines an option type for SCons implementing path settings.

To be used whenever a user-specified path override should be allowed.

**Arguments to PathVariable are:**

- **option-name** = name of this option on the command line (e.g. “prefix”)
- **option-help** = help string for option
- **option-dflt** = default value for this option
- **validator** = [optional] validator for option value. Predefined are:
  - PathAccept – accepts any path setting; no validation
  - PathIsDir – path must be an existing directory
  - PathIsDirCreate – path must be a dir; will create
  - PathIsFile – path must be a file
  - PathExists – path must exist (any type) [default]

The validator is a function that is called and which should return True or False to indicate if the path is valid. The arguments to the validator function are: (key, val, env). The key is the name of the option, the val is the path specified for the option, and the env is the env to which the Options have been added.

Usage example:

**Examples:**

prefix=/usr/local

opts = Variables()

```python
opts = Variables()
opts.Add(PathVariable('qtdir',
   'where the root of Qt is installed',
   qtdir, PathIsDir))
opts.Add(PathVariable('qt_includes',
   'where the Qt includes are installed',
   '$qtdir/includes', PathIsDirCreate))
```
Add user-friendly customizable variables to an SCons build.

```python
class SCons.Variables.Variables(files=None, args=None, is_global=True)
Bases: object
Holds all the options, updates the environment with the variables, and renders the help text.
If is_global is True, this is a singleton, create only once.

Parameters:
- files (optional) – List of option configuration files to load (backward compatibility). If a single string is passed it is automatically placed in a file list (Default value = None)
- args (optional) – dictionary to override values set from files. (Default value = None)
- is_global (optional) – global instance? (Default value = True)
```

```python
Add(key, help='', default=None, validator=None, converter=None, **kw)
Add an option.

Parameters:
- key – the name of the variable, or a list or tuple of arguments
- help – optional help text for the options (Default value = “”)
- default – optional default value for option (Default value = None)
- validator – optional function called to validate the option’s value (Default value = None)
- converter – optional function to be called to convert the option’s value before putting it in the environment. (Default value = None)
- **kw – keyword args, unused.
```

```python
AddVariables(*optlist)
Add a list of options.
Each list element is a tuple/list of arguments to be passed on to the underlying method for adding options.

Example:
```python
opt.AddVariables(
    ('debug', '', 0),
    ('CC', 'The C compiler'),
    ('VALIDATE', 'An option for testing validation', 'notset', validator, None),
)
```

```python
FormatVariableHelpText(env, key, help, default, actual, aliases=[])`n
```

```python
GenerateHelpText(env, sort=None)
Generate the help text for the options.
env - an environment that is used to get the current values
of the options.
cmp - Either a function as follows: The specific sort function should take two arguments and return -1, 0 or 1
or a boolean to indicate if it should be sorted.
```

```python
Save(filename, env)
Saves all the options in the given file. This file can then be used to load the options next run. This can be used to create an option cache file.
filename - Name of the file to save into env - the environment get the option values from.
```

```python
UnknownVariables()
Returns any options in the specified arguments lists that were not known, declared options in this object.
```
Update (env, args=None)
Update an environment with the option variables.

env - the environment to update.

_do_add (key, help=", default=None, validator=None, converter=None)

format = \'\n%s: %s\n default: %s\n actual: %s\'

format__ = \'\n%s: %s\n default: %s\n actual: %s\n aliases: %s\'

instance = None

keys ()
Returns the keywords for the options
